

3.3.2 Cod (*Gadus morhua*) in subareas 1 and 2 (Northeast Arctic)

ICES stock advice

ICES advises that when the Joint Russian–Norwegian Fisheries Commission management plan is applied, catches in 2017 should be no more than 805 000 tonnes. Bycatch of coastal cod and *Sebastes norvegicus* should be kept as low as possible.

Stock development over time

The spawning-stock biomass (SSB) has been above $MSY B_{trigger}$ since 2002. The total stock biomass (TSB) reached a peak in 2013 and has now dropped slightly. Fishing mortality (F) was reduced from well above F_{lim} in 1997 to below F_{MSY} in 2007 and the most recent estimate is just below F_{MSY} . Surveys indicate that year classes 2011–2014 are above or around the long-term average.

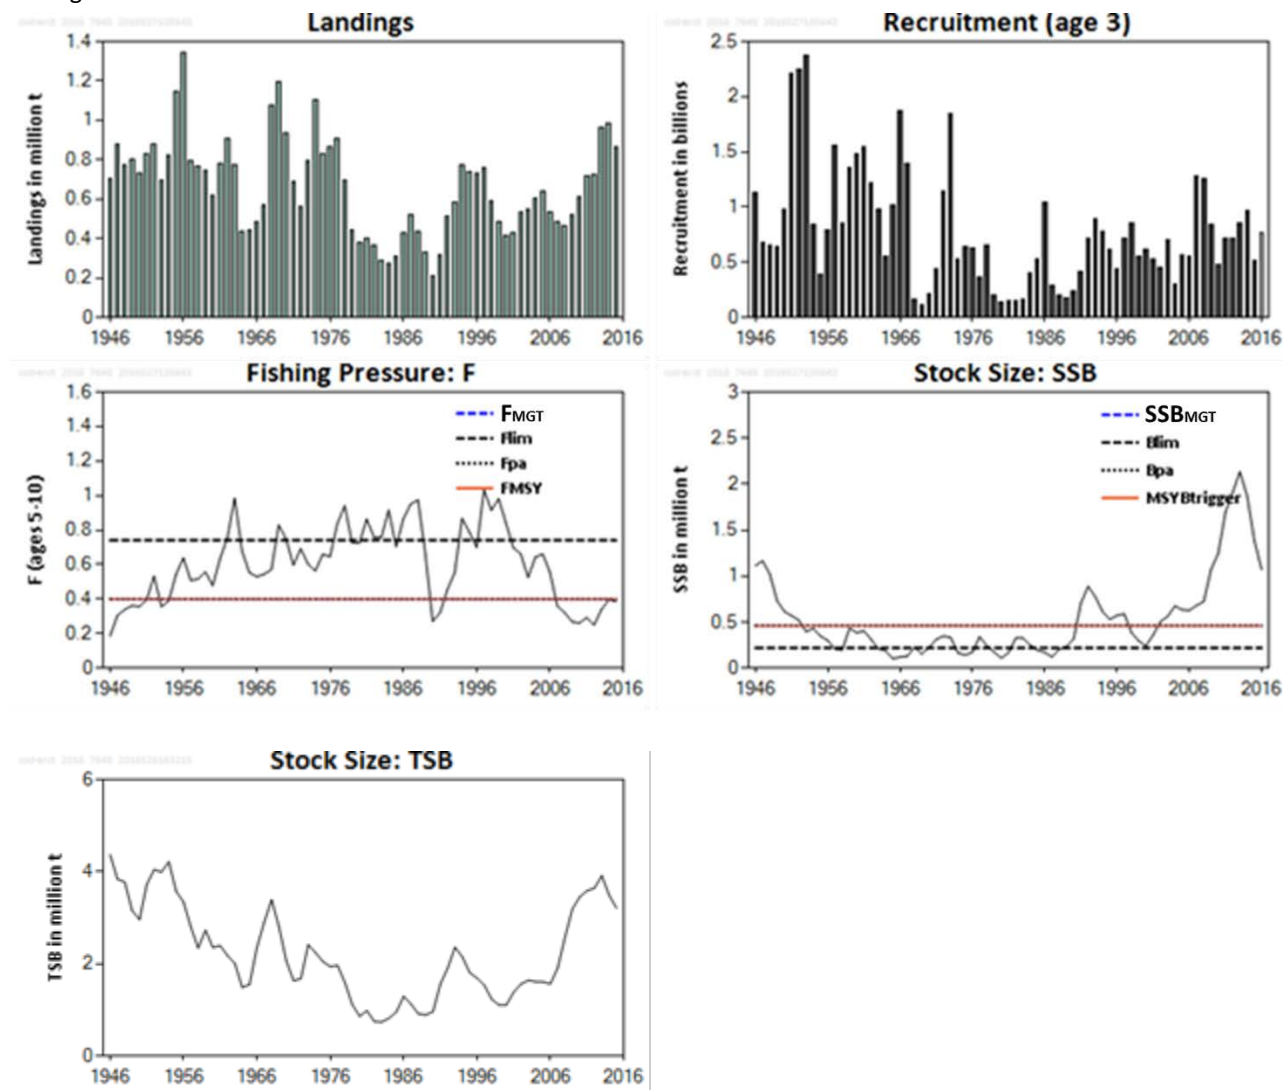

Figure 3.3.2.1 Cod in subareas 1 and 2 (Northeast Arctic). Landings, recruitment, SSB, F, and TSB. Time-series used in the assessment. For this stock, $F_{MGT} = F_{MSY} = F_{pa}$, and $SSB_{MGT} = MSY B_{trigger} = B_{pa}$; therefore, the horizontal lines representing these points in the graph overlap.

Stock and exploitation status

Table 3.3.2.1 Cod in subareas 1 and 2 (Northeast Arctic). State of the stock and fishery relative to reference points.

		Fishing pressure			Stock size					
		2013	2014	2015	2014	2015	2016			
Maximum sustainable yield	F_{MSY}	✓	✓	✓	Appropriate	MSY	✓	✓	✓	Above trigger
Precautionary approach	F_{pa}, F_{lim}	✓	✓	✓	Harvested sustainably	B_{pa}, B_{lim}	✓	✓	✓	Full reproductive capacity
Management plan	F_{MGT}	✓	✓	✓	Below	SSB_{MGT}	✓	✓	✓	Above

Catch options

Table 3.3.2.2 Cod in subareas 1 and 2 (Northeast Arctic). The basis for the catch options.

Variable	Value	Source	Notes
$F_{ages\ 5-10}$ (2016)	0.39	ICES (2016a)	<i>F status quo</i> (2015)
SSB (2017)	1147 kt	ICES (2016a)	
R_{age3} (2016)	766 millions	ICES (2016a)	Recruitment model estimate
R_{age3} (2017)	897 millions	ICES (2016a)	Recruitment model estimate
R_{age3} (2018)	930 millions	ICES (2016a)	Recruitment model estimate
Total catch (2016)	767 kt	ICES (2016a)	Catch corresponding to <i>F status quo</i>

Table 3.3.2.3 Cod in subareas 1 and 2 (Northeast Arctic). The catch options. Weights in thousand tonnes.

Rationale	Catches (2017)	Basis	F (2017)	SSB (2018)	%SSB change*	%TAC change**

	890	HCR 9; $F = 0.50^{^^}$, no constraint, 3-year average, if low capelin stock $^{^^^}$	0.46	1068	-7	0
	886	HCR 10; $F = 0.47^{^^}$, no constraint, 2-year average	0.46	1070	-7	-1

* SSB 2018 relative to SSB 2017.

** Catch 2017 relative to TAC 2016.

*** Catch decided by limit of -10% change compared to TAC 2016.

^ Harvest control rules evaluated by ICES (2016b). HCR 2 is the rule in the current management plan.

^^ Rules 6–10 prescribe increases in F at high SSB values. The F value given in the ‘basis’ column corresponds to the value derived from the rule when calculating F based on the 2017 SSB value.

^^^ Rules 8–9 are dependent on the 2016 capelin stock estimate, which is not yet known. As the 2015 capelin stock estimate was low, the values shown here assume that the 2016 capelin stock estimate will also be low.

Basis of the advice

Table 3.3.2.4 Cod in subareas 1 and 2 (Northeast Arctic). The basis of the advice.

Advice basis	Joint Russian–Norwegian Fisheries Commission management plan.
Management plan	<p>At the 38th meeting of the Joint Russian–Norwegian Fisheries Commission (JRNFC) in November 2009, the previously used management plan was amended (marked in bold) and currently states:</p> <p><i>“The Parties agreed that the management strategies for cod and haddock should take into account the following:</i></p> <p><i>conditions for high long-term yield from the stocks</i> <i>achievement of year-to-year stability in TACs</i> <i>full utilization of all available information on stock development</i></p> <p><i>On this basis, the Parties determined the following decision rules for setting the annual fishing quota (TAC) for Northeast Arctic cod (NEA cod):</i></p> <p><i>estimate the average TAC level for the coming 3 years based on F_{pa}. TAC for the next year will be set to this level as a starting value for the 3-year period.</i></p> <p><i>the year after, the TAC calculation for the next 3 years is repeated based on the updated information about the stock development, however the TAC should not be changed by more than +/- 10% compared with the previous year’s TAC. If the TAC, by following such a rule, corresponds to a fishing mortality (F) lower than 0.30 the TAC should be increased to a level corresponding to a fishing mortality of 0.30.</i></p> <p><i>if the spawning stock falls below B_{pa}, the procedure for establishing TAC should be based on a fishing mortality that is linearly reduced from F_{pa} at B_{pa}, to $F=0$ at SSB equal to zero. At SSB-levels below B_{pa} in any of the operational years (current year, a year before and 3 years of prediction) there should be no limitations on the year-to-year variations in TAC.”*</i></p> <p>At the 39th Session of the Joint Russian–Norwegian Fisheries Commission in October 2010 it was agreed that the current management plan should be used “for five more years” before it is evaluated. At the 45th Session of the Joint Russian–Norwegian Fisheries Commission in 2015 it was decided that a number of alternative harvest control rules (HCRs) for Northeast Arctic cod should be evaluated by ICES. ICES provided advice on these harvest control rules in 2016 (ICES, 2016b).</p>

* This quotation is taken from Annex 14 in the Protocol of the 38th Session of the Joint Russian–Norwegian Fisheries Commission and translated from Norwegian to English. For an accurate interpretation, please consult the text in the official languages of the Commission (Norwegian and Russian).

Quality of the assessment

Sampling of commercial catches is believed to be less precise because of the termination of a Norwegian port sampling programme in mid-2009. Russian sampling of commercial catches has decreased in recent years. Poor sampling of commercial catches is impairing the quality of the assessment and the advice.

Discards are known to have taken place but cannot be quantified (assumed to be below 5% in recent years).

With the recent expansion of the cod distribution, the joint winter trawl and acoustic surveys do not presently cover the whole stock distribution area.

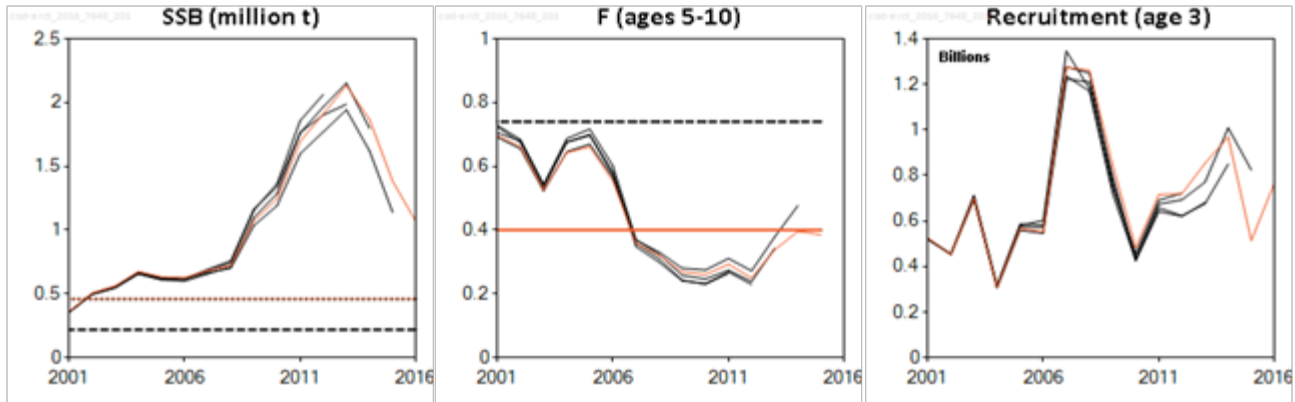

Figure 3.3.2.2 Cod in subareas 1 and 2 (Northeast Arctic). Historical assessment results (final-year recruitment estimates included).

Issues relevant for the advice

The cod stock has a high abundance of old fish and the assessment model is sensitive to this. The estimated fishing mortalities for the strong year classes 2004–2005 are unexpectedly high for 2015 (Figure 3.3.2.3). This may indicate that the abundance of these year classes is underestimated in this year’s assessment. ICES will conduct an Inter-benchmark (IBP) process to work through the spring of 2017 to review the assessment for this stock.

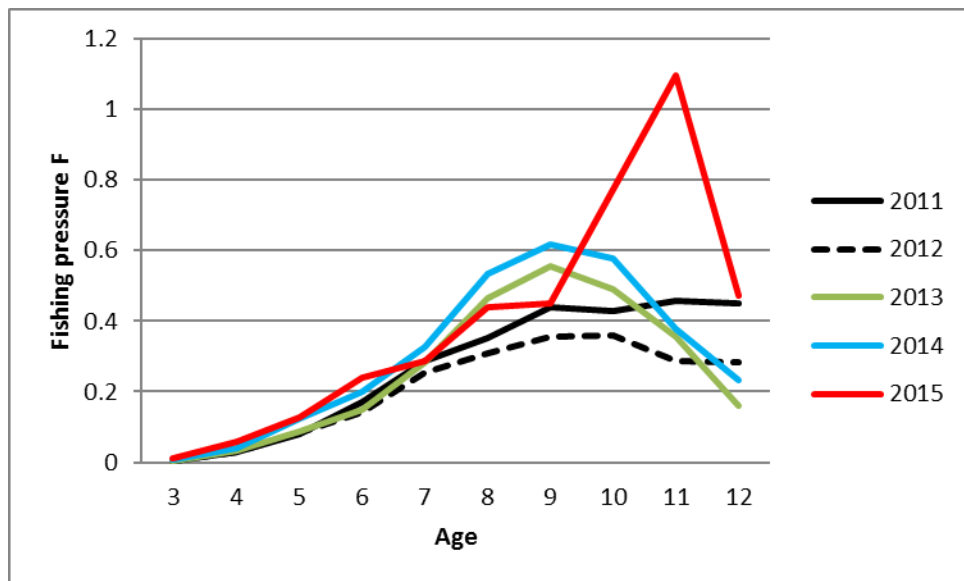

Figure 3.3.2.3 Cod in subareas 1 and 2 (Northeast Arctic). Estimated fishing mortalities by age for the last five years.

Fisheries targeting Northeast Arctic (NEA) cod have as a bycatch a considerable part of the total golden redfish (*Sebastes norvegicus*) catch, and the bycatch of this species is still far above any sustainable catch level. Measures to minimize bycatch levels are essential.

Bycatch of coastal cod should be kept as low as possible in order to obtain the reductions in fishing mortality implied by the coastal cod (*Gadus morhua*) rebuilding plan.

Reference points

Table 3.3.2.5 Cod in subareas 1 and 2 (Northeast Arctic). Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	460 000 t	B_{pa} , and trigger point in HCR.	ICES (2003)
	F_{MSY}	0.40	Long-term simulations.	ICES (2005)
Precautionary approach	B_{lim}	220 000 t	Change point regression.	ICES (2003)
	B_{pa}	460 000 t	The lowest SSB estimate having >90% probability of remaining above B_{lim} .	ICES (2003)
	F_{lim}	0.74	F corresponding to an equilibrium stock = B_{lim} .	ICES (2003)
	F_{pa}	0.40	The highest F estimate having >90% probability of remaining below F_{lim} .	ICES (2003)
Management plan	SSB_{MGT}	460 000 t	B_{pa} , TAC linearly reduced from F_{pa} at $SSB = B_{pa}$ to zero at $SSB = 0$.	
	F_{MGT}	0.40	F_{pa} , average TAC for the coming three years based on F_{pa} .	

Basis of the assessment

Table 3.3.2.6 Cod in subareas 1 and 2 (Northeast Arctic). The basis of the assessment.

ICES stock data category	1 (ICES, 2016c)
Assessment type	Age-based analytical assessment (XSA) with cannibalism estimated. Catches are used in the model and in the forecast. Following the benchmark from 2015, cannibalism is also estimated for the period 1946–1983; previously it was included only from 1984 to the present. This has had an impact on historical recruitment and total stock biomass estimates.
Input data	Commercial catches (international landings, ages and length frequencies from catch sampling); four survey indices (Joint bottom trawl survey Barents Sea, Feb–Mar (BS-NoRu-Q1 (BTr)); Joint acoustic survey Barents Sea and Lofoten, Feb–Mar (BS-NoRu-Q1 (Aco)); Russian bottom trawl survey, October–December (RU-BTr-Q4)); Joint Ecosystem survey (Eco-NoRu-Q3 (Btr)); annual maturity data from the four surveys; natural mortalities from annual stomach sampling.
Discards and bycatch	Discarding is considered negligible in recent years (below 5%). Bycatch is included.
Indicators	None
Other information	Last benchmarked in January 2015 (WKARCT; ICES, 2015).
Working group	Arctic Fisheries Working Group (AFWG)

Information from stakeholders

There is no available information.

History of the advice, catch, and management
