### Introduction

At the last Hake Age estimation Workshop conducted in November, 2009 (WKAEH 2009, ICES 2010) it was recommended that a new otolith exchange be undertaken in order to build on the findings of the Workshop. It was proposed that the WebGR tool (which is available at <http://webgr.azti.es/>) would be used for reading and subsequent analysis. WebGR was developed to support the organization and data analysis of calibration workshops for both age and maturity information. The main goal of this exercise was to assess the impact of moving the interpretation criteria on precision. IEO was responsible for the organization and coordination of the exchange that started on the 6<sup>th</sup> of April and finished on the 30<sup>th</sup> of June of 2011.

### Objectives

- To analyse the results of the hake otolith exchange to check the precision and bias of readers when using the new guidelines described at the last workshop (WKAEH 2009).
- To test WebGR as an otolith exchange tool.

### Material and Methods

Readers from 8 research institutes: MI, IPIMAR, IEO, IFREMER, AZTI, COISPA and HCMR participated in the exchange. All readers, except R13 and R15, were involved in the previous workshop (WKAEH 2009).

Reader	Name	Institution	Degree of Exp.	Country
R1	C. Piñeiro	IEO	Expert	Spain
R2	M. Sainza	IEO	Expert	Spain
R3	J. Rey	IEO	New	Spain
R6	S. Dores	IPIMAR	Expert	Portugal
R8	J. Felix	IFREMER	Expert	France
R9	S. Beattie	MI	Expert	Ireland

R11	P. Carbonara	COISPA	Expert	Italy
R12	J.L. Pérez	IEO	Intermediate	Spain
R13	A. Maceira	AZTI	Expert	Spain
R15	T. Woods	CEFAS	Intermediate	England
R16	E. Lefkaditou	HCMR	New	Greece
R18	S. Warnes	CEFAS	Expert	England

The exchange collection consisted of calibrated digital images of otolith sections from 237 fish collected during all seasons of 2006. An excel workbook including additional information, like date and area of capture, total length and sex of respective specimens, has been also provided to the readers. The length range of fish selected was between 20 cm and 80 cm TL (Figure 1) from ICES Divisions VIIIC-IXa. Sectioned otoliths were prepared by IEO using standard procedures for calcified structures as described by Piñeiro *et al.* (1996). The interpretation of the otoliths was based on the new guidelines agreed in the last Workshop (WKAEH 2009, ICES 2010) in order to improve the precision of age estimation:

- Each annulus (annual translucent zone) consists of bands of several thinner translucent rings. Interpreting these individual components of the *annuli* as complete *annuli*, is a potential cause of over estimation of age when reading hake otoliths.
- Using different levels of magnification helps to reveal the pattern of translucent and opaque bands within the section. Changing the source of light from transmitted to reflect light can also help in the interpretation of the otolith.
- Marking the location of the *annuli* (annual translucent zones): for inter-calibration exercises, each image should be marked at the point where each annulus ends and the following season's opaque growth begins. This is difficult to interpret in hake, but it is the outer edge of the last translucent band/ring in each group of these zones or rings, that the reader considers to represent an annulus.
- The growth pattern should be considered based on growth bands around the whole of the transversal section (TS), including both axes, ventral and dorsal.

The sample used in the exchange was also read by two expert readers (R1 and R2) using the traditional method employed prior to the 2009 Workshop (Piñeiro & Sainza, 2003). This allowed for estimation of intra-readers precision using different otolith interpretation criteria: the traditional method previously agreed and new guidelines established at the last workshop (WKAEH 2009, ICES 2010).

Otolith interpretation was undertaken on digital images that were available at WebGR. All readers were required to annotate the rings they considered to be *annuli* on digital images by using the WebGR tool (Figure 1). The information provided to the readers was:

1. WebGR manual with the instructions on how to use the package.
2. Ageing protocol on hake otolith reading (PROTOCOL\_HKEXCH\_11.doc)
3. Date of capture and sex of the fish to be aged.
4. The otolith size, since every otolith image has a bar scale of 1 mm.

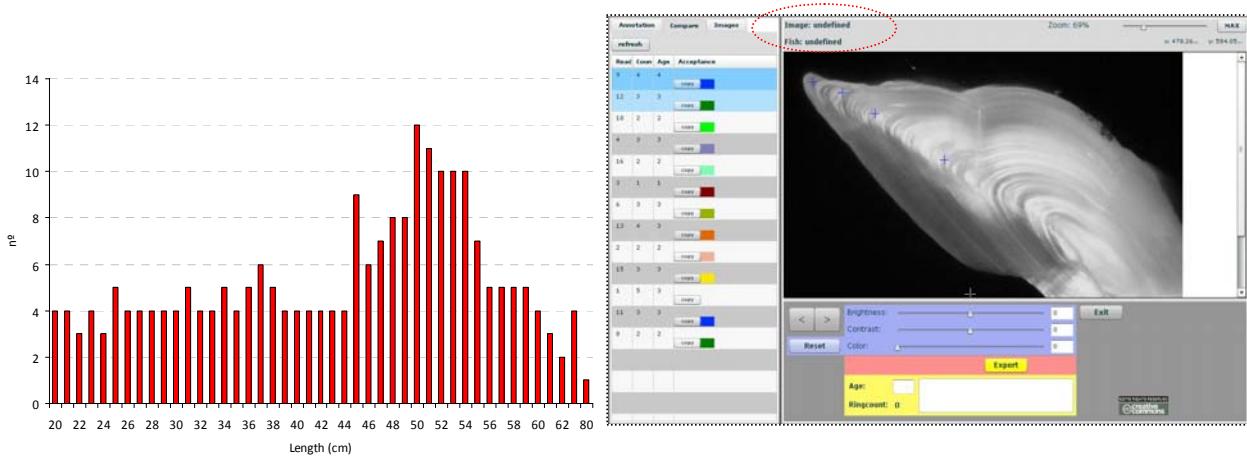

Figure 1.-Length frequency distribution of the fish sampled (left) and WebGR screen for otolith ring annotations (right). The browse annotation screen shows otolith section interpreted by reader. (The red circle indicates the lack of information from image and fish attributes).

Once the exchange was completed by all readers the application was used to produce a statistical table with the results of the calibration exercise showing the following parameters:

- Average percent age error (APE), Beamish and Fournier (1981):

$$APE = \frac{100}{n} \sum_{i=1}^n \left( \frac{1}{r} \sum_{j=1}^r \frac{|x_{ij} - \bar{x}_i|}{\bar{x}_i} \right)$$

$n$  = number of otoliths

$r$  = number of readings for each otolith

$x_{ij}$  = the  $j$  value of age estimation for the  $i$  otolith

$\bar{x}_i$  = average age calculated for the  $i$  otolith

- Coefficient of Variation (CV):

$$CV = \frac{100}{n} \left[ \sum_{i=1}^n \left( \frac{sd}{\bar{x}_i} \right)^2 \right]$$

$sd$  = the standard deviation for the  $i$  otolith

In order to test the results of the statistical analysis undertaken by WebGR, the Excel ad-hoc Workbook for age reading comparison (Eltink *et al.*, 2000) which has been used in calibration exercises conducted so far was also completed. Additional results were obtained based on the following analysis:

- **PA (percentage of agreement):**  $100 \times (\text{no. of readers agreeing with modal age}/\text{total no. of readers})$ .
- **Box-whisker plot:** to summarise the observations and comparing the distribution of the otolith readings by reader.

## RESULTS:

1. - **Inter-readers calibration exercises** The results of readings and the basic information about otolith collection are summarized in (**annexes 1 and 2**):

- **Outcomes of Web GR:** the average of CV and of APE obtained from all readers were 33.1% and 2.17% respectively (Table 2).
- **Excel ad-hoc Workbook:** the average of CV and APE obtained from all readers were 33.1% and 24.9 % respectively. In addition the PA value was 62.3% (Table 2).

Age range estimated was between 0 to 6 ages. All these results indicated a low level of precision which was also demonstrated by the analysis of the annotated images that showed a high variation in the perception of bands or growth structures among readers (Figure 2).

The interpretation of bands by readers presented high variability as it was displayed in the Box-whisker plot as consequence of difficulty of applying the new guidelines (Figure 3). This plot indicate too that the subjective interpretation of successive opaque and translucent zones is not restricted to the readers without experience or only larger fish but common across all size analyzed. The majority of readers assigned ages between 1 and 3.

2.- **Comparative analysis** Both tools gave the same results for CV but not for APE. This means that WebGR does not calculate APE correctly (Table 2). In addition, this application neither calculated the mean value of CV for the whole exercise and nor the PA.

All readers (N:12)						
Method	N	Fish range TL (cm)	Age range (years)	APE %	PA %	CV %
WebGR ( <a href="http://webgr.berlios.de">http://webgr.berlios.de</a> )	237	20-80	0-6	2.2	NA	NA
Excel ad-hoc workbook (Eltink <i>et al.</i> , 2000)				24.9	62.3	33.1

Table 2.- Outcomes of Web GR and Excel ad-hoc Workbook based on the guidelines established at the last Workshop (WKAEH 2009).

3.- **Intra-readers** precision for the traditional method and new guidelines are given in the following table:

R1&R2	N	PA	CV	APE
Traditional method	237	70.0	6.4	4.4
New guidelines		46.0	26.2	17.5

Table 3.- Results obtained by using both methods employed by two expert readers.

guidelines are not validated yet and the precision management in the absence of accuracy cannot, under any account, guarantee data quality (De Pontual *et al.*, 2006). Furthermore these new guidelines were established more in a descriptive way to help in the interpretation of the band formation of increments around the otolith than on a rigorous study of ring pattern formation. Therefore this produces a high level of subjectivity in the interpretation.

WebGr was a very useful tool to use for the purposes of this exchange since it saves both time and money and presents also potential advantages for running calibration exercises among different countries and institutions. Table 4, summarizes the advantages and the necessary improvements required to improve the functionality of WebGr. Initial use of the package is very encouraging and with the improvements suggested will have widespread support.

<b>Advantages</b>	<b>Improvements</b>
Speed and economy for calibration exercises.	To improve the initial menu and facilitate the upload and download of the images and data.
All participant readers analyze the same images and have exactly the same information.	To correct the calculation of APE and provide the average APE for the whole calibration exercise.
	New outputs are necessary from WebGR: Percentage agreement and the average CV for the whole calibration exercise.
	To provide information on image and fish attributes (see Figure 1) in the annotation browse menu where is displayed the image of otoliths with the rings interpreted by reader.
	Overlapping of the ring marks by reader (see Figure 2).
	To give information from ring distances of reader interpretations.
	To include in the annotation interface the confidence level of the reader on their otolith reading, in order to reflect the quality of the data (good: 1; medium: 2; and unreadable: 3).
	To facilitate the removal of the records of the images or data by sets instead of having to do it one by one as it is now.

Table 4. - Summary of advantages of the WebGR and suggested improvements to improve functionality and ease of use.

## Conclusions

1. The variable degree of participant experience in age determination of hake otoliths produced a high variability in the results.
2. The new guidelines are not sufficient to rule out individual subjectivity of interpretation of hake otoliths. This is due to the lack of a validated method that is necessary to confirm the frequency of growth rings in the otoliths.

3. Results clearly show the unsuitability of these new guidelines since the precision management in the absence of accuracy cannot, under any account, guarantee data quality (De Pontual *et al.*, 2006).
4. We are still not at a stage where we can validate the age of hake from otoliths as the new method is still subjective to a large extent. The new guidelines are a first step towards the age determination of hake from otoliths. However research on the effects of environmental factors on otolith formation in combination with work on daily growth and tagging experiments will add to the overall understanding of the otolith structure and interpretation.
5. The results of this exchange demonstrated that will not be possible to build up a transitional error matrix to rebuild historical ALKs due to the interpretation of hake otoliths for age estimation is imprecise and still cannot be validated.
6. In summary, the use of the WebGR is very useful for calibration exercises; however, some improvements are needed for efficient running of the application in order to encourage general use of the tool (see Table 4).

## **Recommendations**

Including more images using different magnification and lighting methods within exchanges employing tools such as WebGR will help the interpretation of ageing for complex species such as hake reducing the overall costs and speed up the process since the major cost of any ageing workshop or exchange is the costs of getting everyone together.

This work could be undertaken by the appropriate staff with ageing expertise at different institutes and workshops could then be used to review any outcomes of this work which would hopefully speed up the process of obtaining a robust method for determining the age of hake from otoliths.

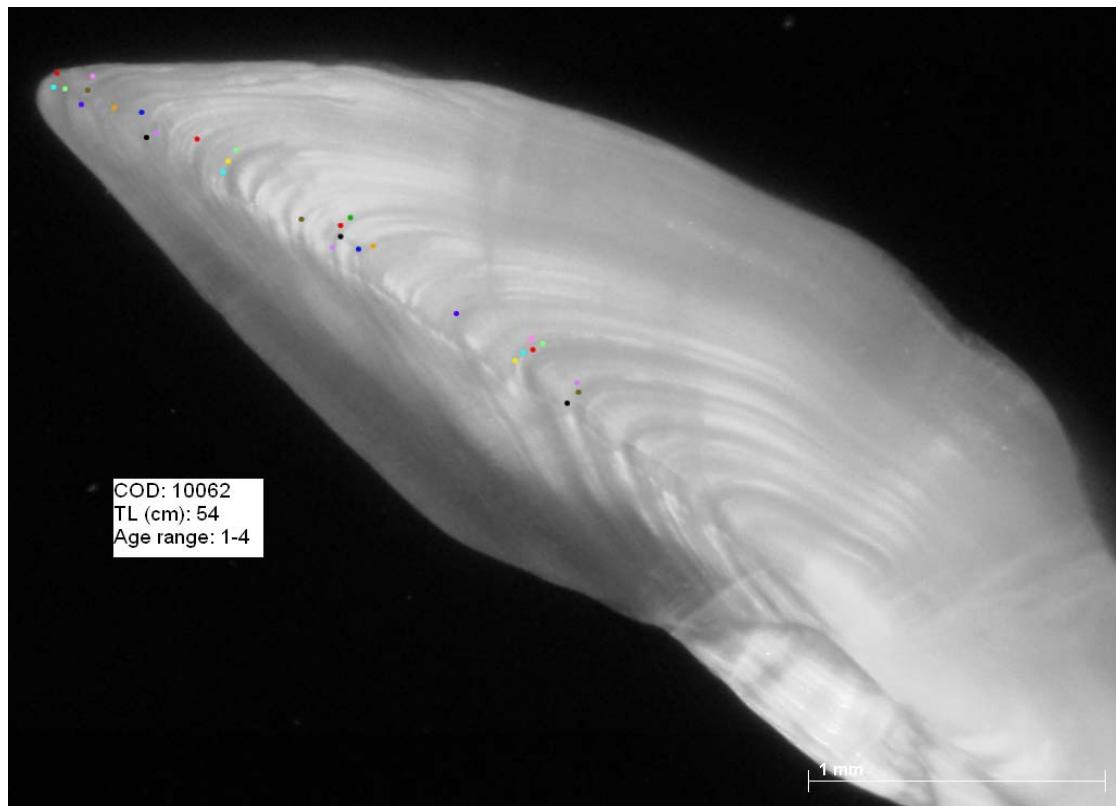

Figure 2. - Interpretation of an otolith from a fish of 54 cm (TL) with the annotated rings overlapped showing the different interpretation done by readers that goes from 1 to 4 ages.

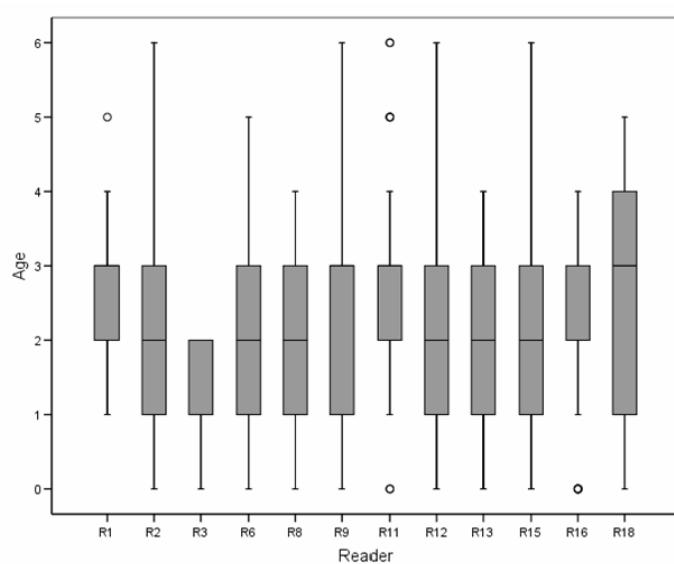

Figure 3.- Box whisker plot of age readings conducted by all readers showing the age estimation values.
