

High-resolution mapping of benthic fishing pressure

Ole R. Eigaard, Francois Bastardie, Niels Hintzen, Rui Catarino Grete E. Dinesen, Heino Fock, Hans Gerritsen, Manuel M. Gonzalez, Patrik Jonsson, Stefanos Kavadas, Pascal Lafargue, Mathieu Lundy, Genoveva G. Mirelis, Jørgen Hansen, Paulette Posen, Jacopo Pulcinella, Tomasso Russo, Antonello Sala, Chris Smith, Bart Vanellander, Mustafa Zengin, J. Rasmus Nielsen, Adriaan D. Rijnsdorp

Estimating fishing pressure from VMS and logbook data

- VMS data hold high resolution information of vessel activity (position, speed and course every hour)
- The EU logbooks contain detailed information of gear type and target species through the assignment of each fishing trip to a given DCF-metier
- The EU logbooks, however, **do not** contain any information on gear size!

Two vessels with identical gear information in EU-logbooks,

OTB_SPF_16-31_0_0

OTB_SPF_16-31_0_0

Claim

- The EU-logbook information of fishing effort is not well suited for meeting the monitoring requirements of the MSFD (e.g. seafloor pressure)
- Key variables of gear size and geometry (e.g. OT door spread) should be incorporated

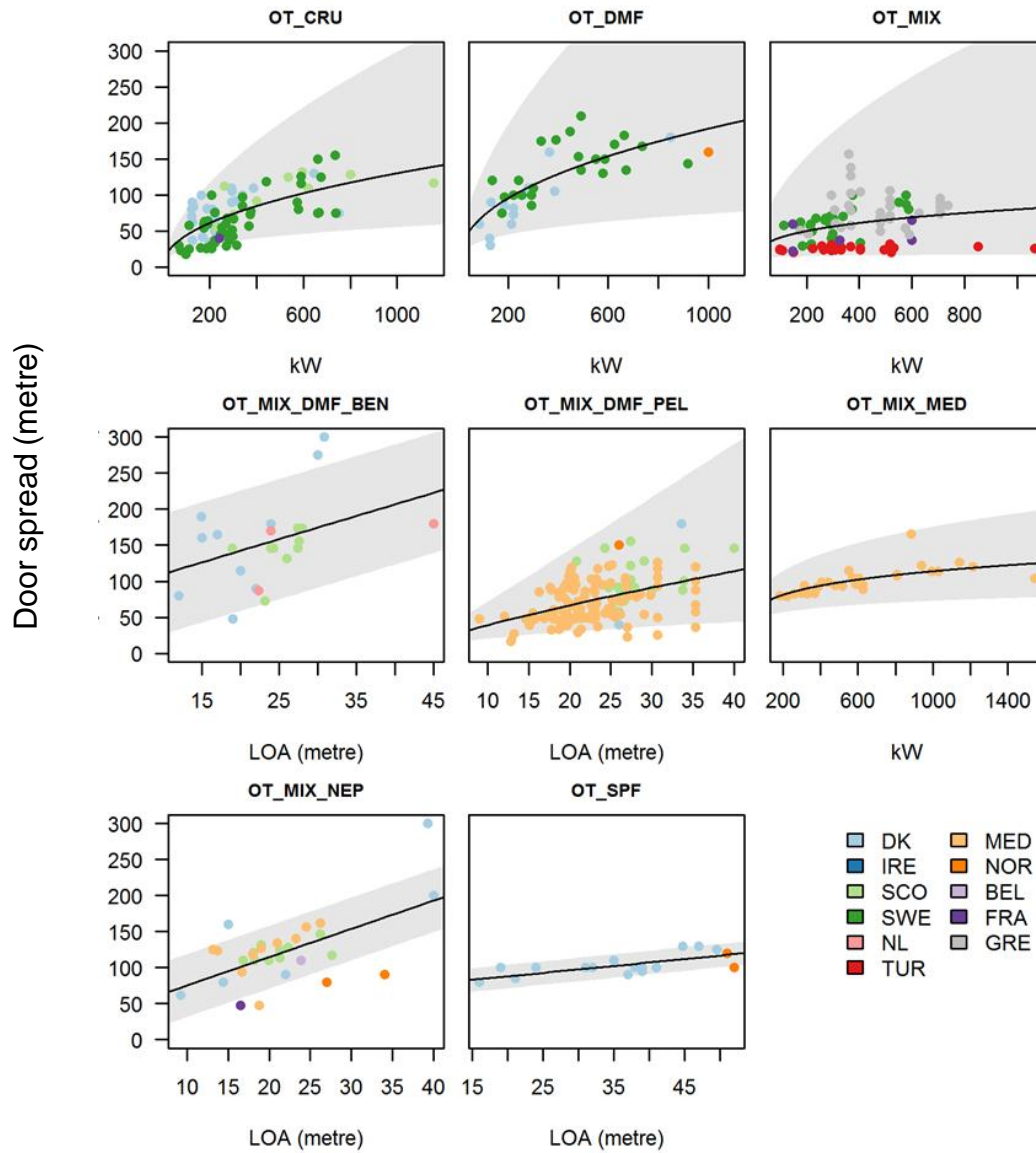

BENTHIS WP2 mapping approach

1. Obtain Vessel and gear data from industry survey
2. Estimate vessel size ~ gear size relationships by metiers
3. Superimpose gear size on logbooks using vessel size as proxy
4. Refine activity, interpolate trawl tracks and estimate swept area by metier from VMS + logbook information
5. Map fishing intensity data at the 1*1 minute (longitude and latitude) scale by metier
6. Overlay fishing intensity and habitat maps

Industry survey coverage

Defining activity at VMS positions

Identify the fishing activity

- Setting/hauling gears
- Fishing
- Steaming

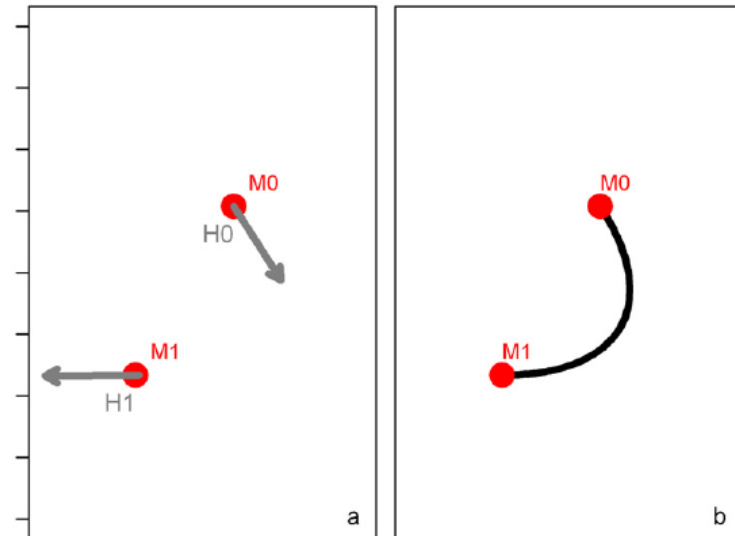

Based on speed profile

Artificially increasing ping rate

Interpolate between pings for towed gears (OT, TBB, and DRB)

- Cubic Hermite spline (Hintzen et al. 2010)

Calculation of swept area and definition of calculation grid

For towed gears

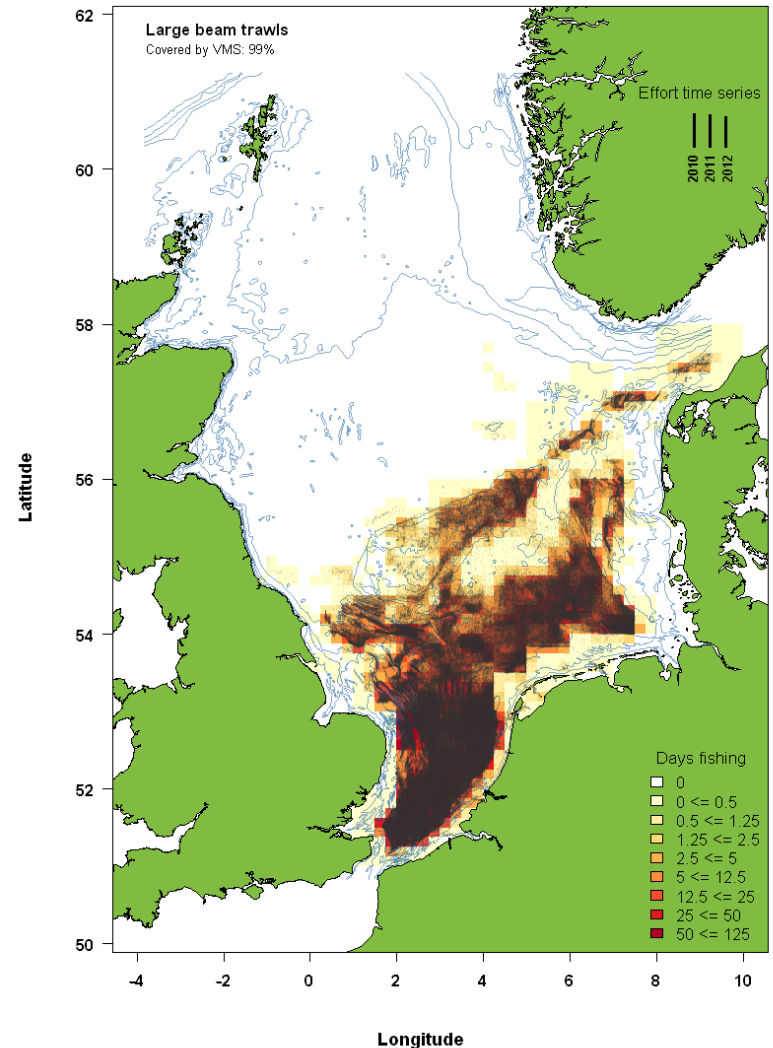

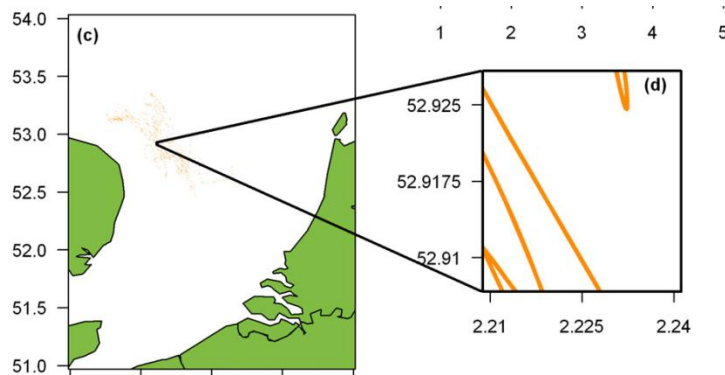

- Each interpolated GPS point is associated with distance travelled and gear width = swept area

For demersal seines

- Geometrical shapes around VMS fishing positions = swept area

Define grid at 1/60 degree by 1/60 degree

- Project each GPS position and associated swept area onto the grid

Final flat file of swept area (km²) per 1*1 minute cells by partner by year and metier

2010	OT_DMF			OT_CRU			Etc.		
	Mean	Upper 95	Lower 95	Mean	Upper 95	Lower 95	Mean	Upper 95	Lower 95
Grid-cell #1	0.94	2.24	0.39	80.4	164.7	39.2			
Grid-cell #2									
Grid-cell #2									
Grid-cell #3

(SDN_DEM)

% of the habitat

Refinements

- Assign uncertainty to pressure maps based on confidence intervals of vessel ~ gear relationships
- Split total swept area map into epifaunal and infaunal pressure level based on gear traits
- Mapping of temporal variation in fishing intensity
- Inclusion logbook (< 10m) and non-logbook vessels (< 10m)
- Inclusions of passive gears
