

# Estuarine and catchment disturbance indicators and the response of the zooplankton biomass size frequency distribution

ICES/PICES 6ZPS 2016/W1

Iain **Suthers**, Emma Tang, Jason D. Everett,  
Jocelyn Dela Cruz and Darren Ryder

Wednesday 11 May 2016, Bergen

THE UNIVERSITY OF  
NEW SOUTH WALES

Office of  
Environment  
& Heritage

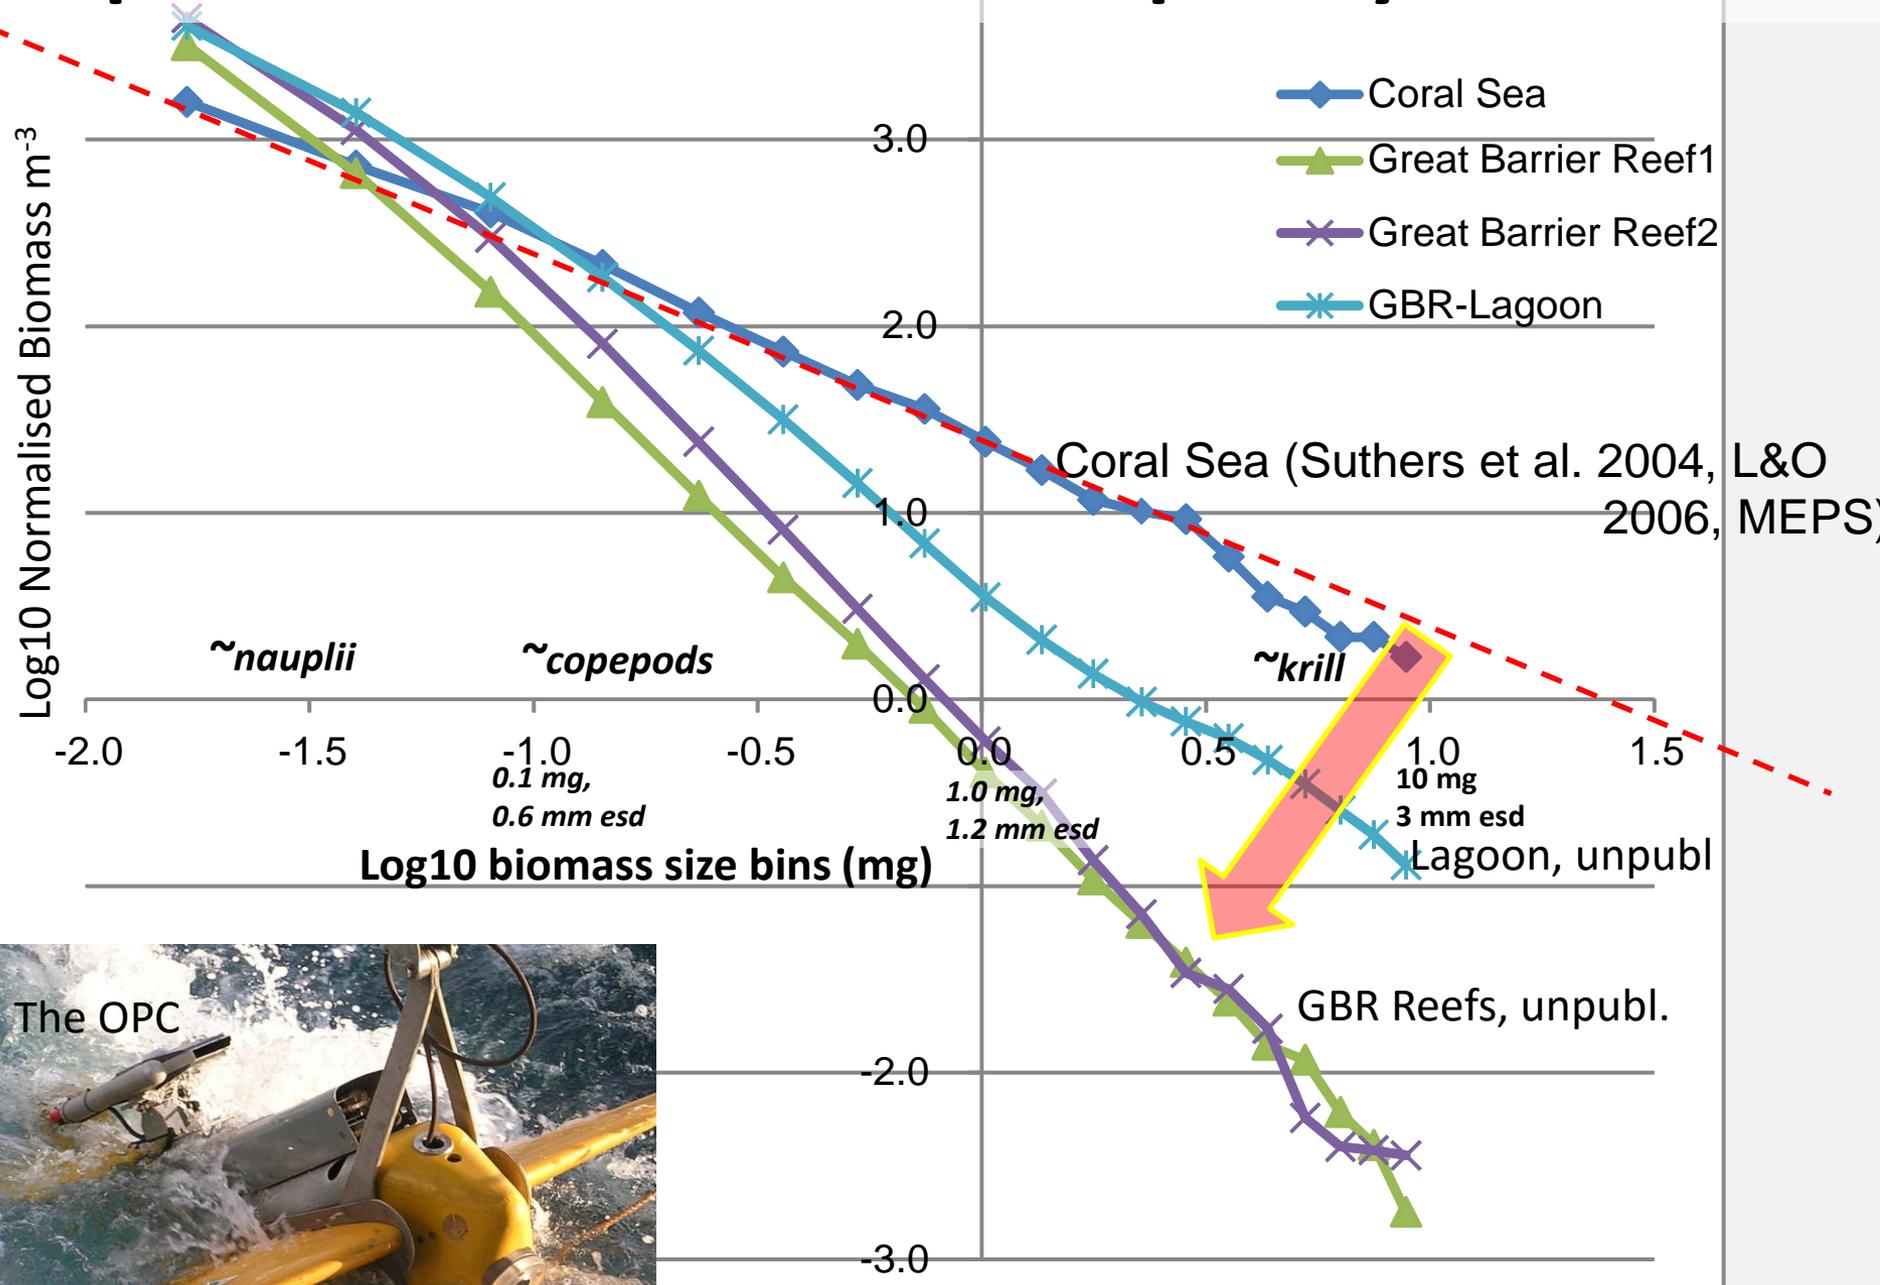

# Sydney Institute of Marine Science

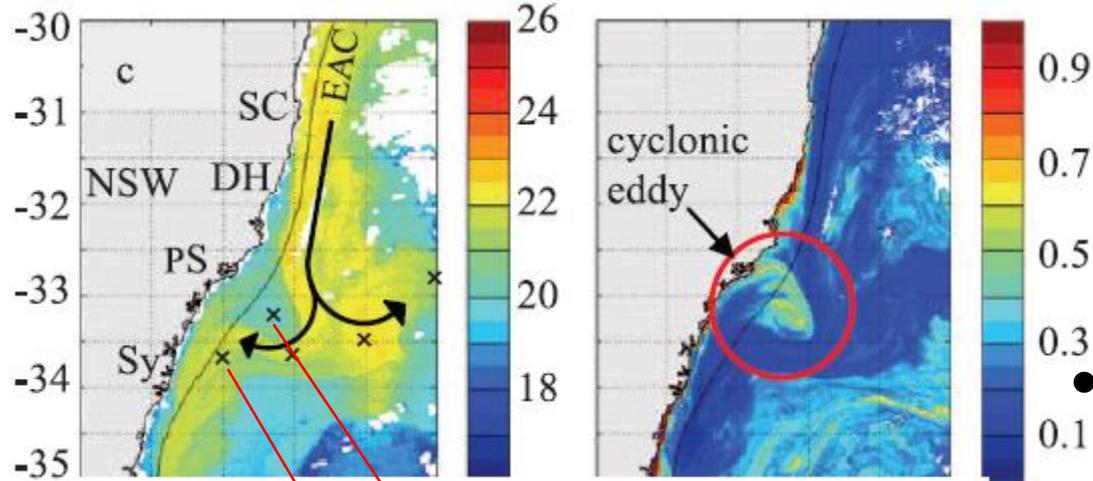

UNSW

Equal partnership of 4 universities

# Zooplankton biomass size frequency distribution

# Dynamic !

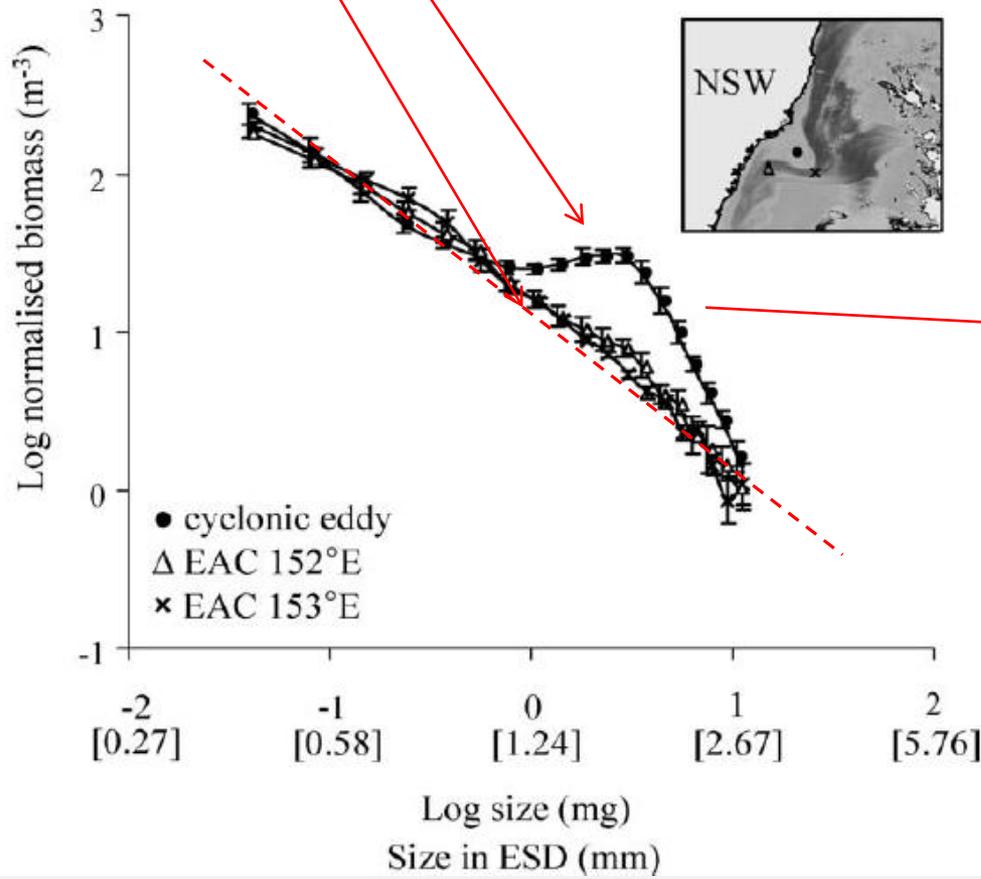

- Entrainment from the inner shelf;

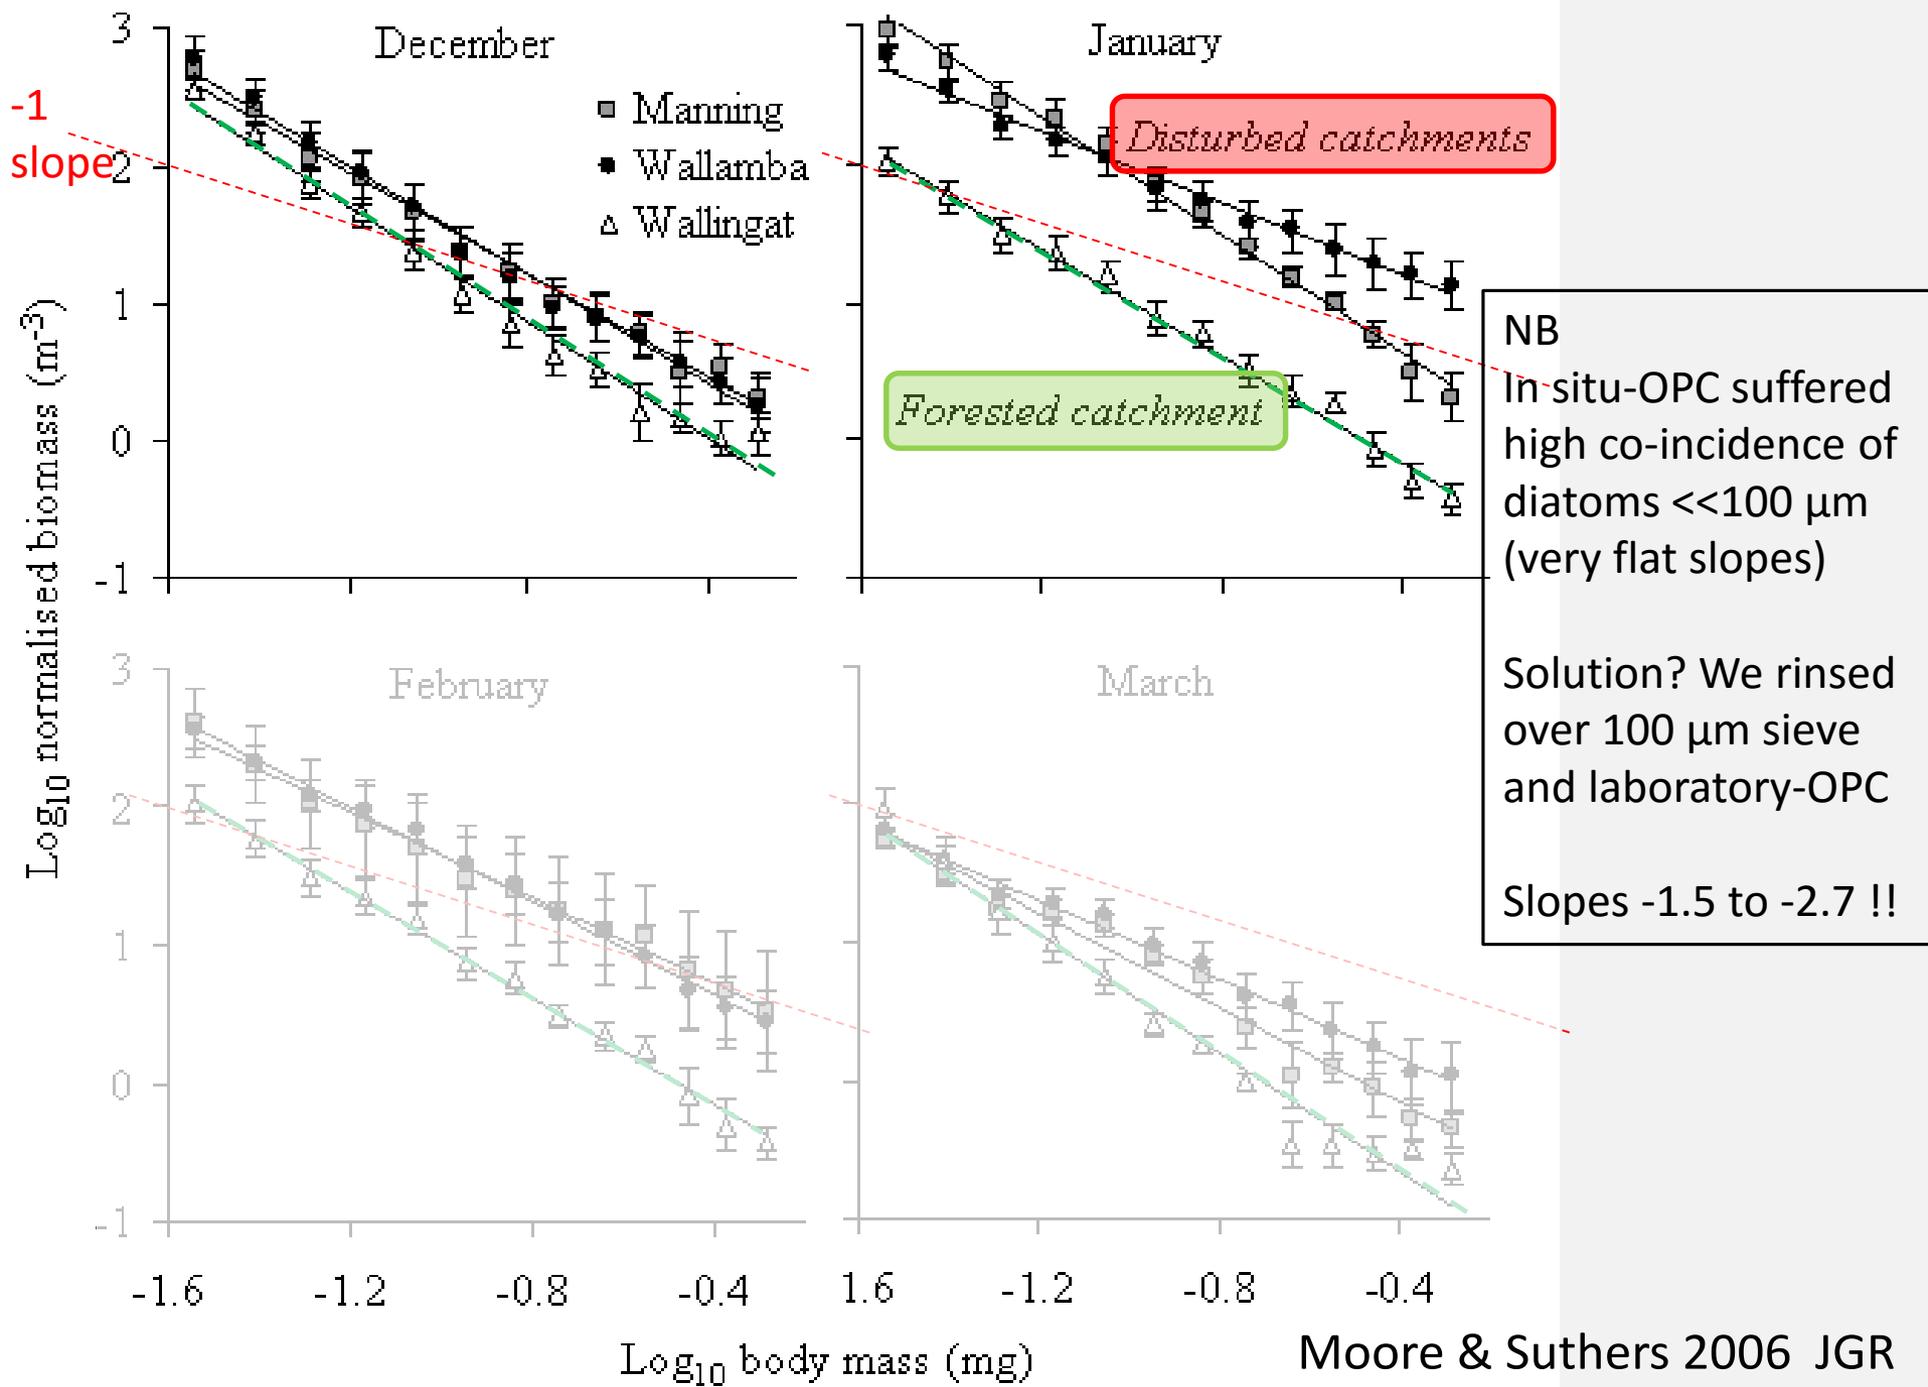

- The 'bump' composed of juvenile krill

- *E. similis*

- And small salps
- *T. democratica*

- And many larval fish

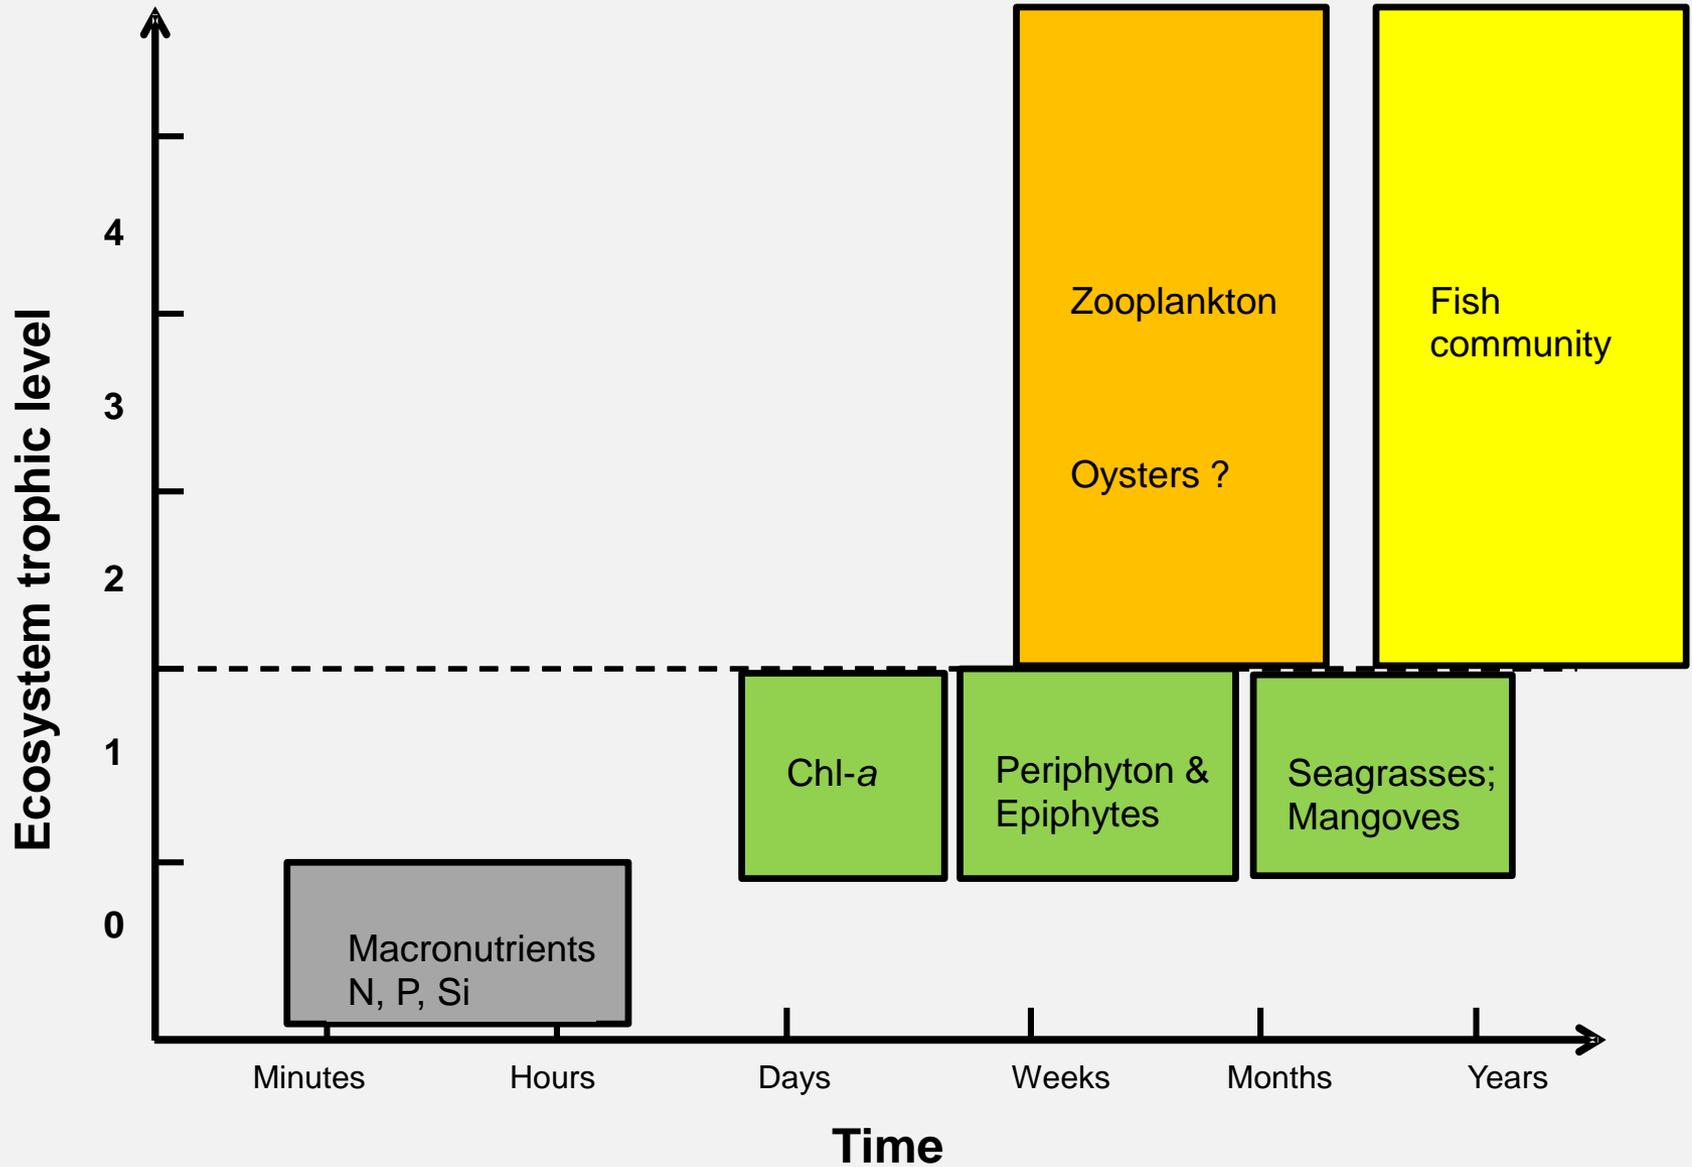

Estuary *disturbance indices* for  
SE Australia ??

# Estuary disturbance indices for SE Australia

- Over 50 indices!
  - Chl-a, turbidity, %change in seagrass-mangroves, fish community, % clearing, population/km<sup>2</sup>, etc
  - Disturbance Index DI =  
**Total N flow / estimated historical TN** (Roper et al. 2011)
  - i.e. 1x historical? Double? Triple? (5 is bad)
- But a DI is static!
- Estuaries are dynamic, rainfall, seasonal
- Kuprika et al. (2012)
  - Geometric Mean Size, Pareto intercept and slope,
  - Continental Shelf Res. 36: 29-40

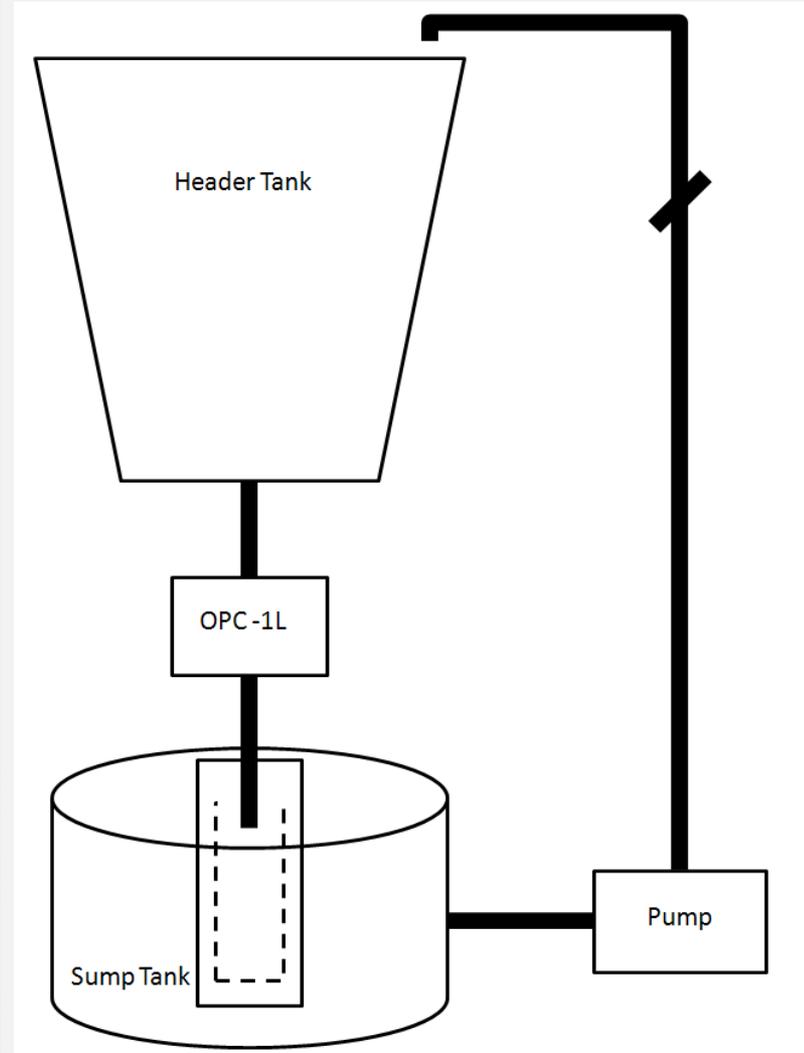

# Ecosystem indicators

# Aims

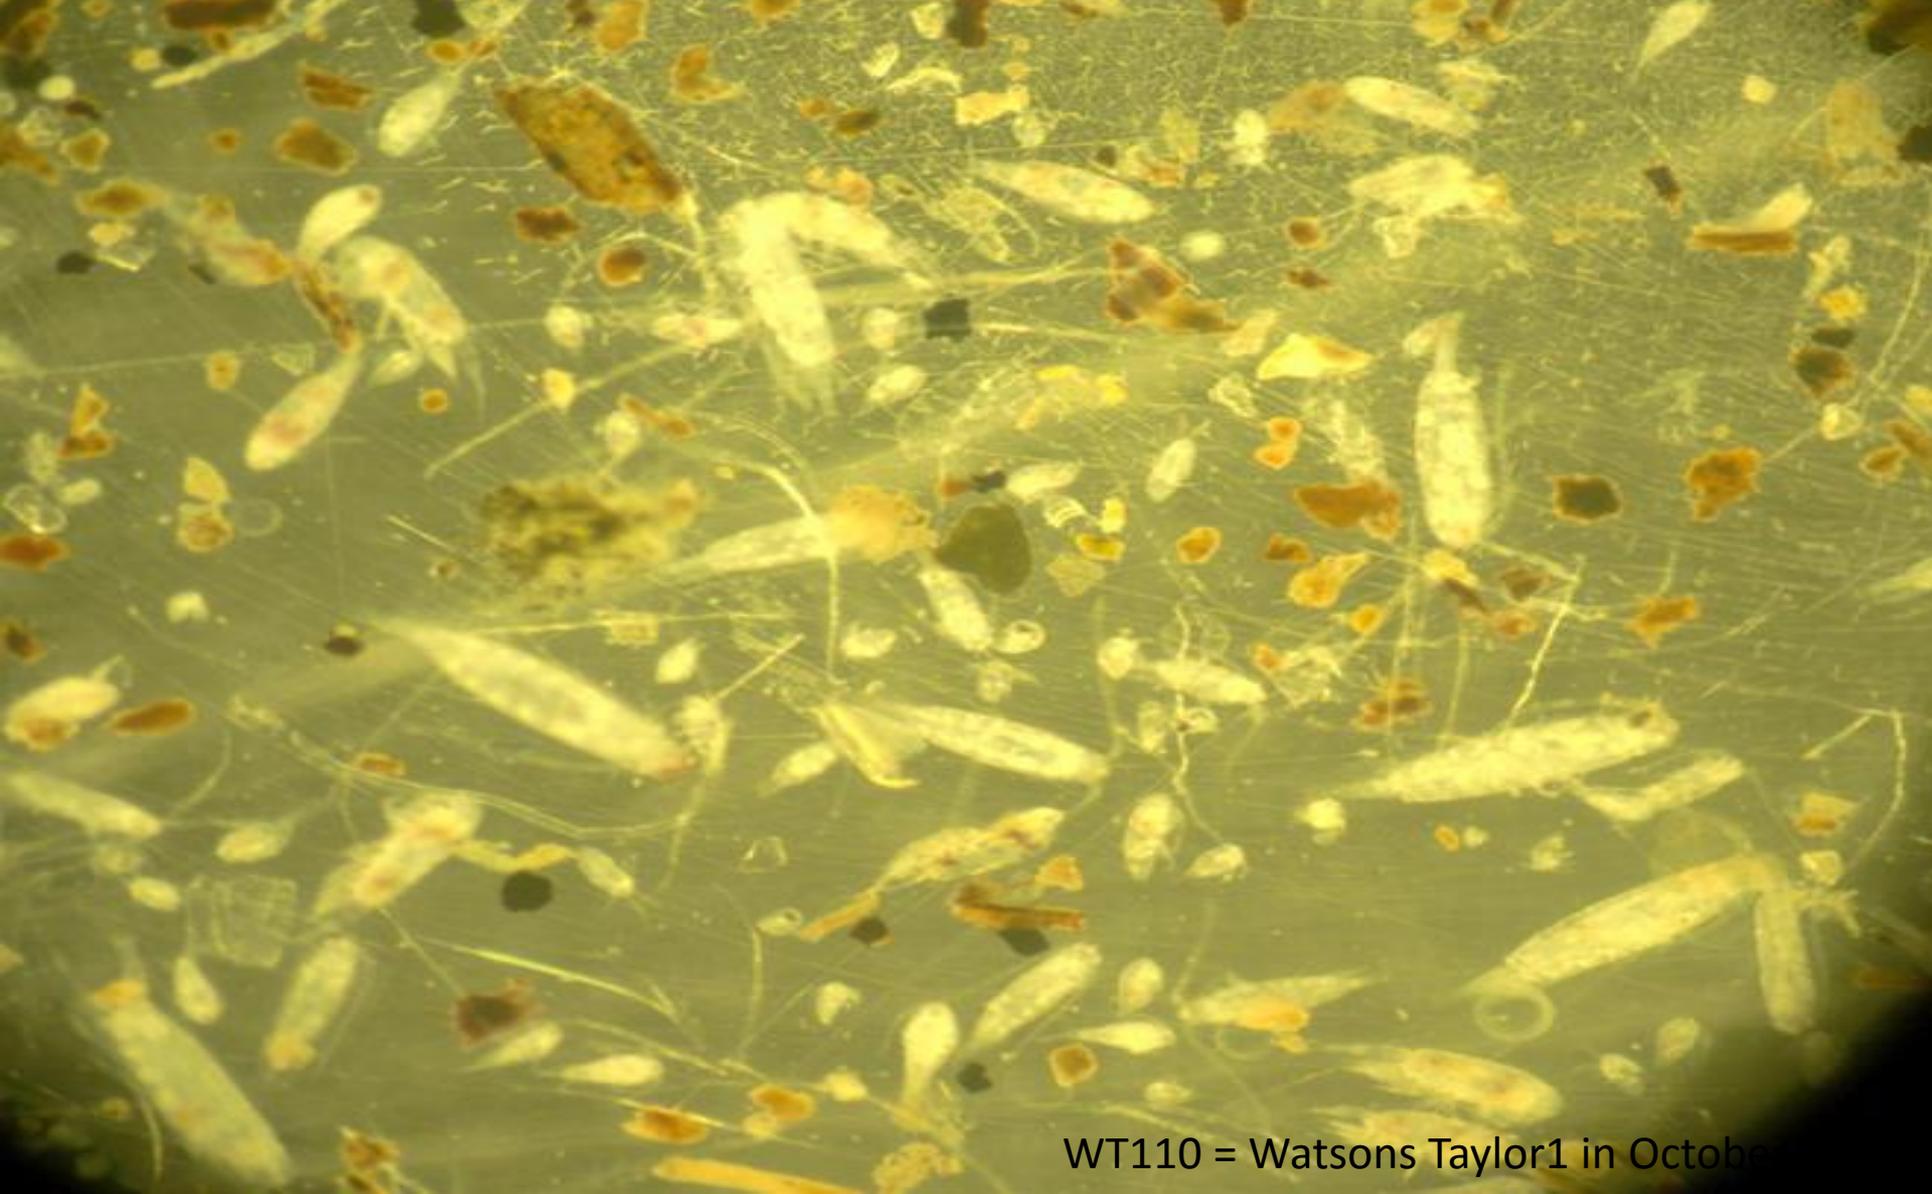

- Comparison of NBSS between 2 estuaries
  - Slope (linearity?)
  - Weighted average size?
- Quantitative indices of water quality?
- Problems in estuaries – detritus, seasonality
- Opportunities in estuaries – citizen science

# Method

Problem - detritus, faecal pellets

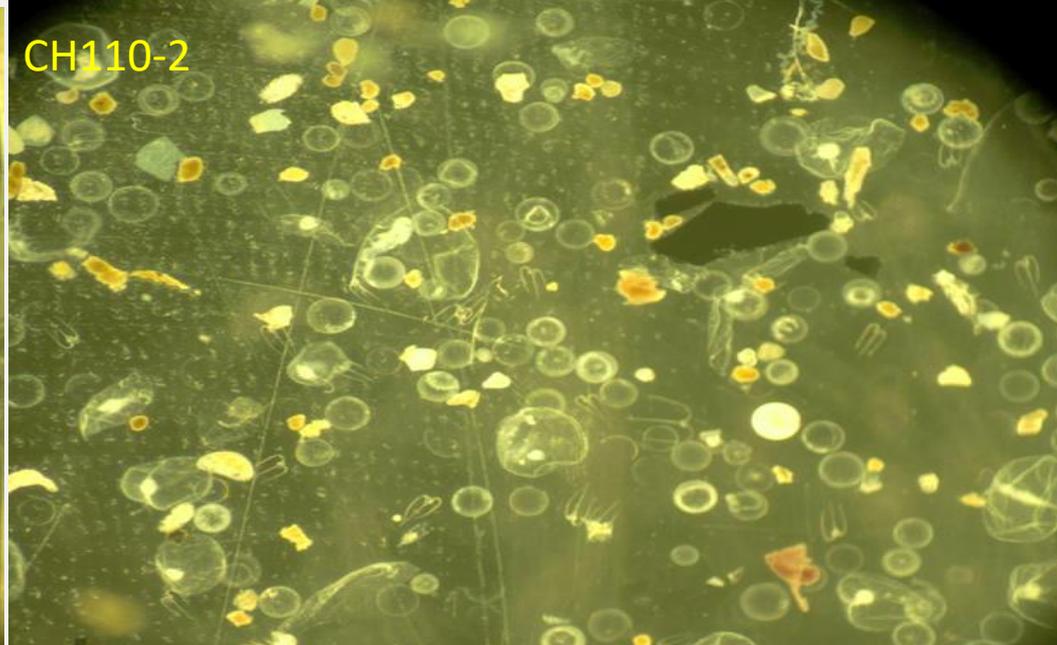

Solution? – mostly carbon; ~10% threshold

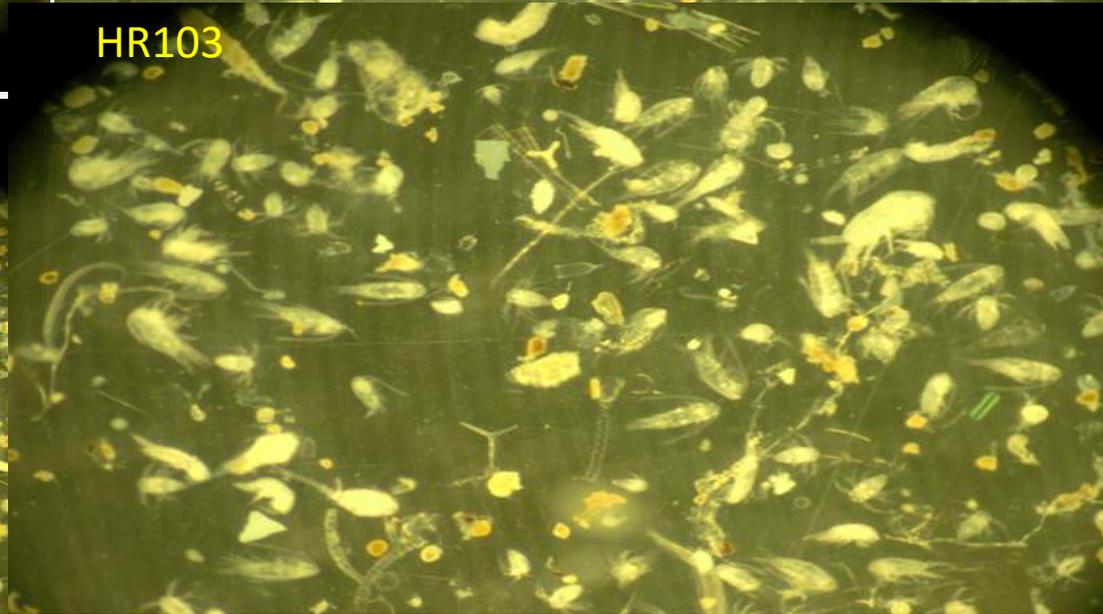

CH110

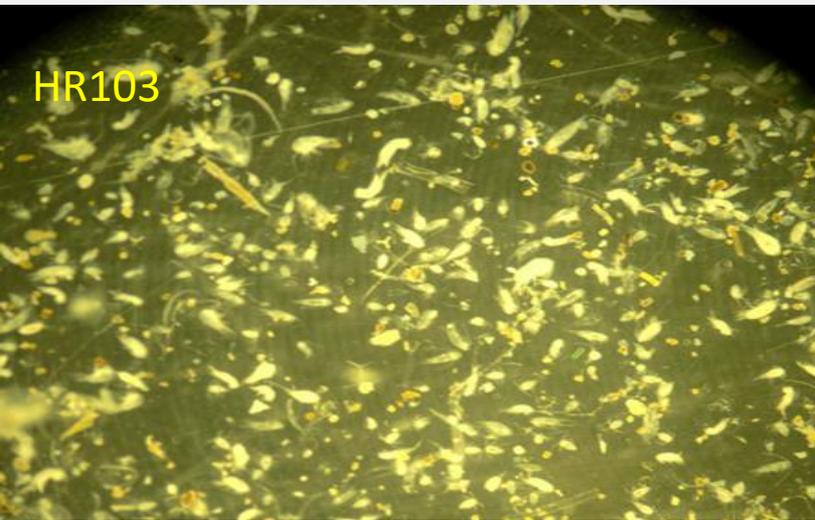

CH110-2

HR103

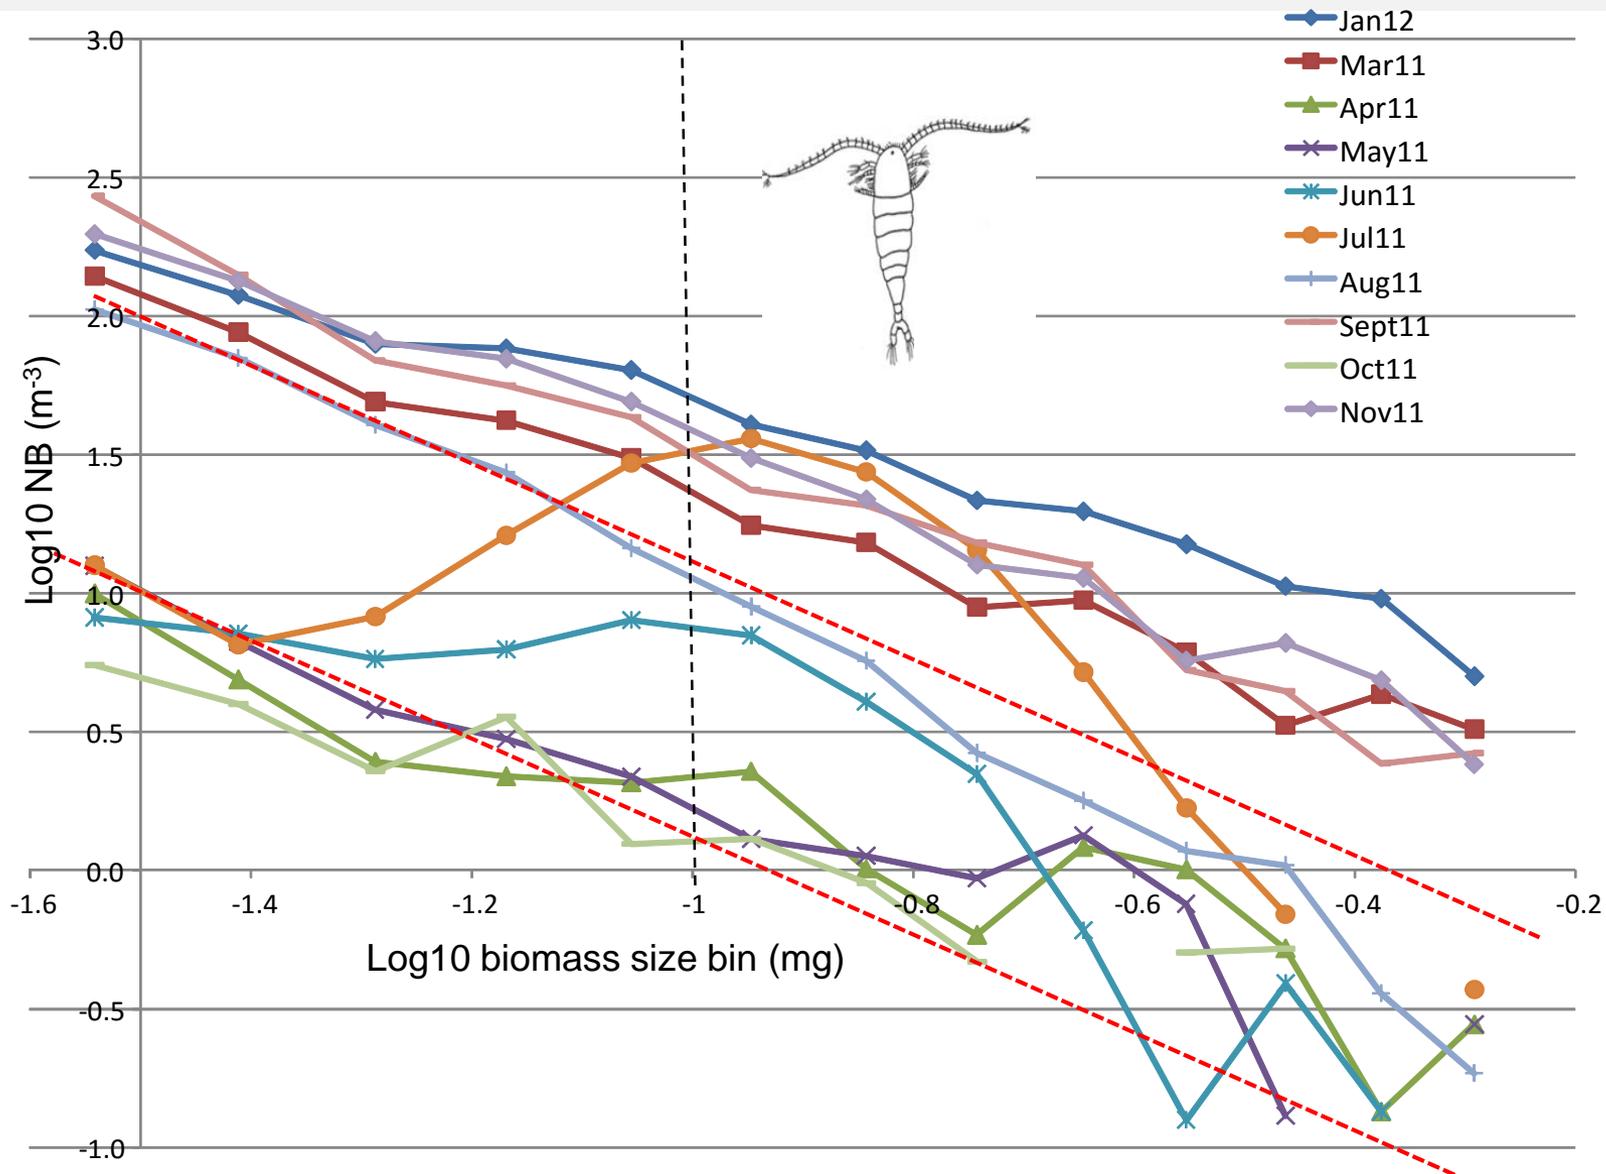

HR103

Each size category includes omnivores, but also vastly different rates

# Monthly changes in the Camden Haven River

# Summer, 2 sites each

Camden Haven R.

Hastings R.

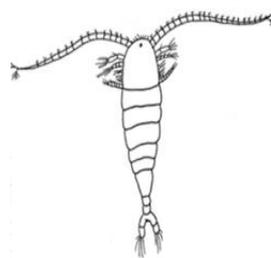

Log10 normalised biomass concentration ( $m^{-3}$ )

Log10 biomass size bin (mg)

-2;  
(0.01 mg  
0.27 mm)

-1;  
(0.1 mg  
0.58 mm)

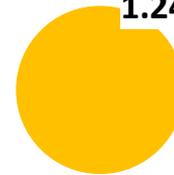

0;  
(1.0 mg  
1.24 mm)

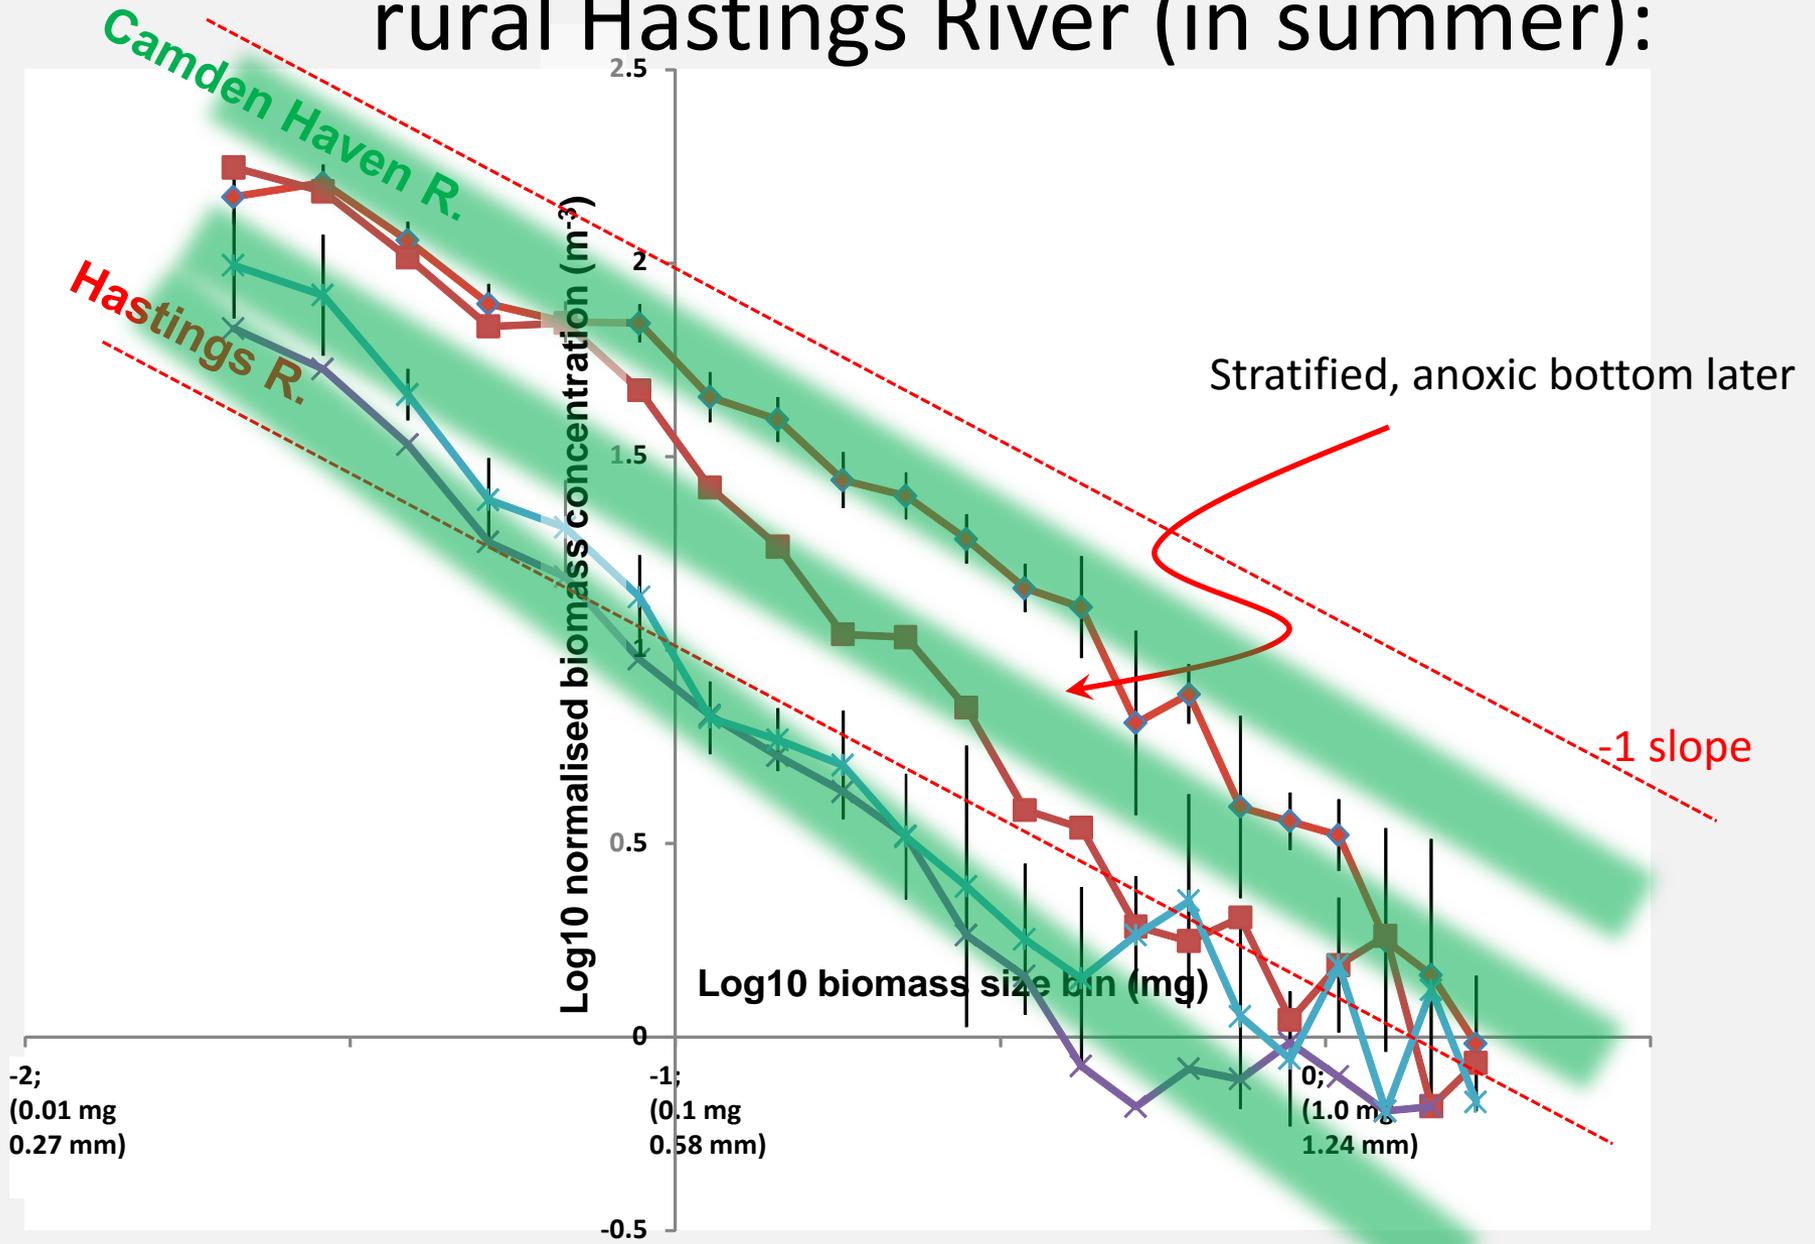

Key points:

- Normalised biomass
- Log10 biomass (mg)
- Narrow size range
  - 0.3- 2 mm ESD
  - 0.01-1 mg
- ∴ mostly linear (else Pareto)

-1 slope

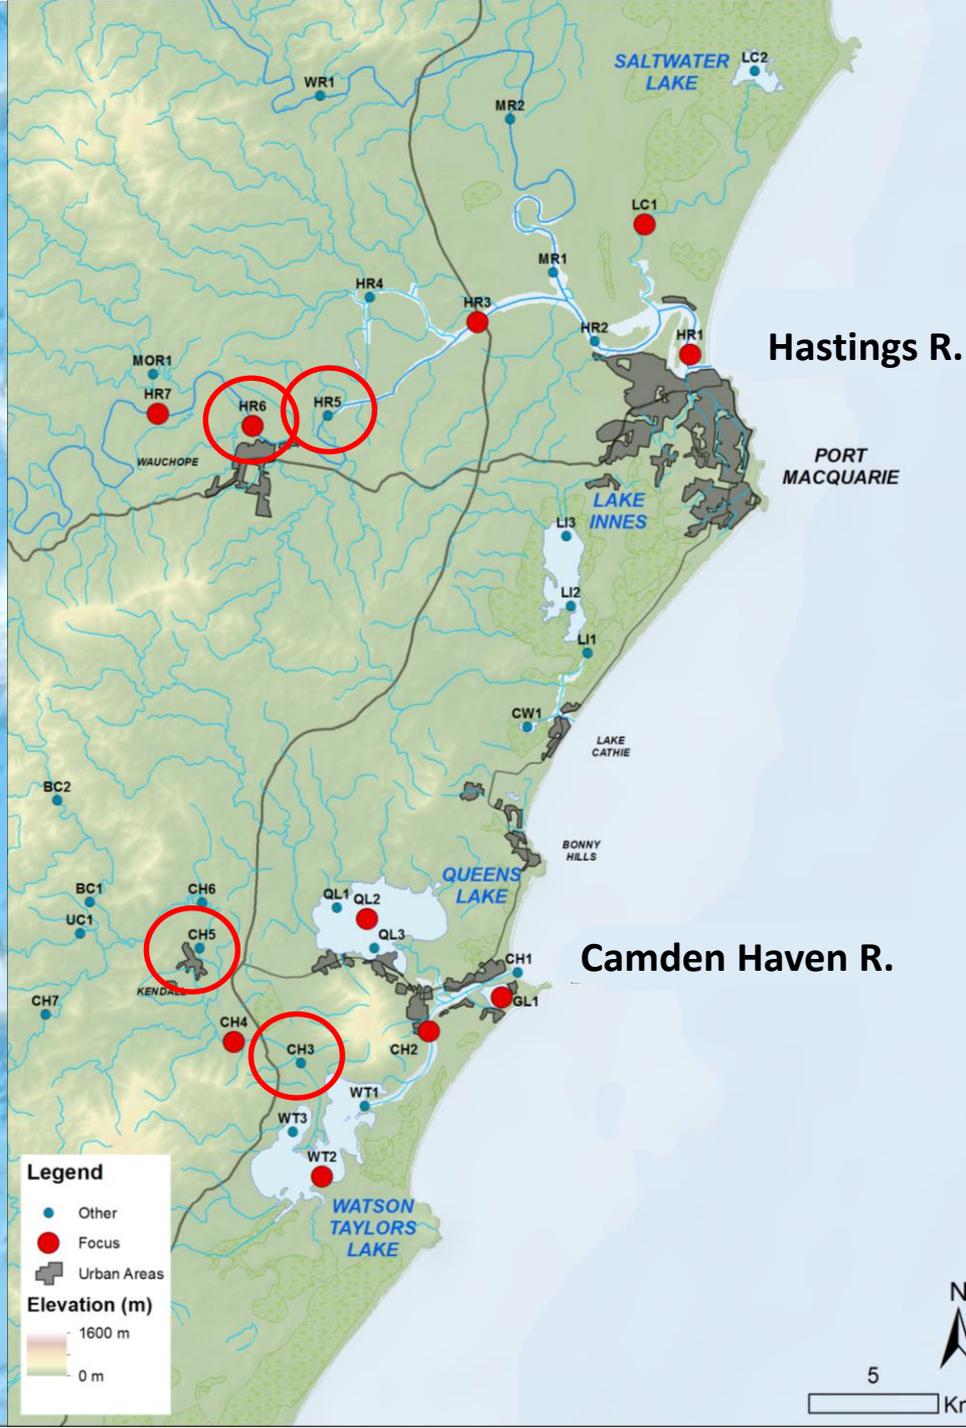

# “pristine” Camden Haven ?? versus rural Hastings River (in summer):

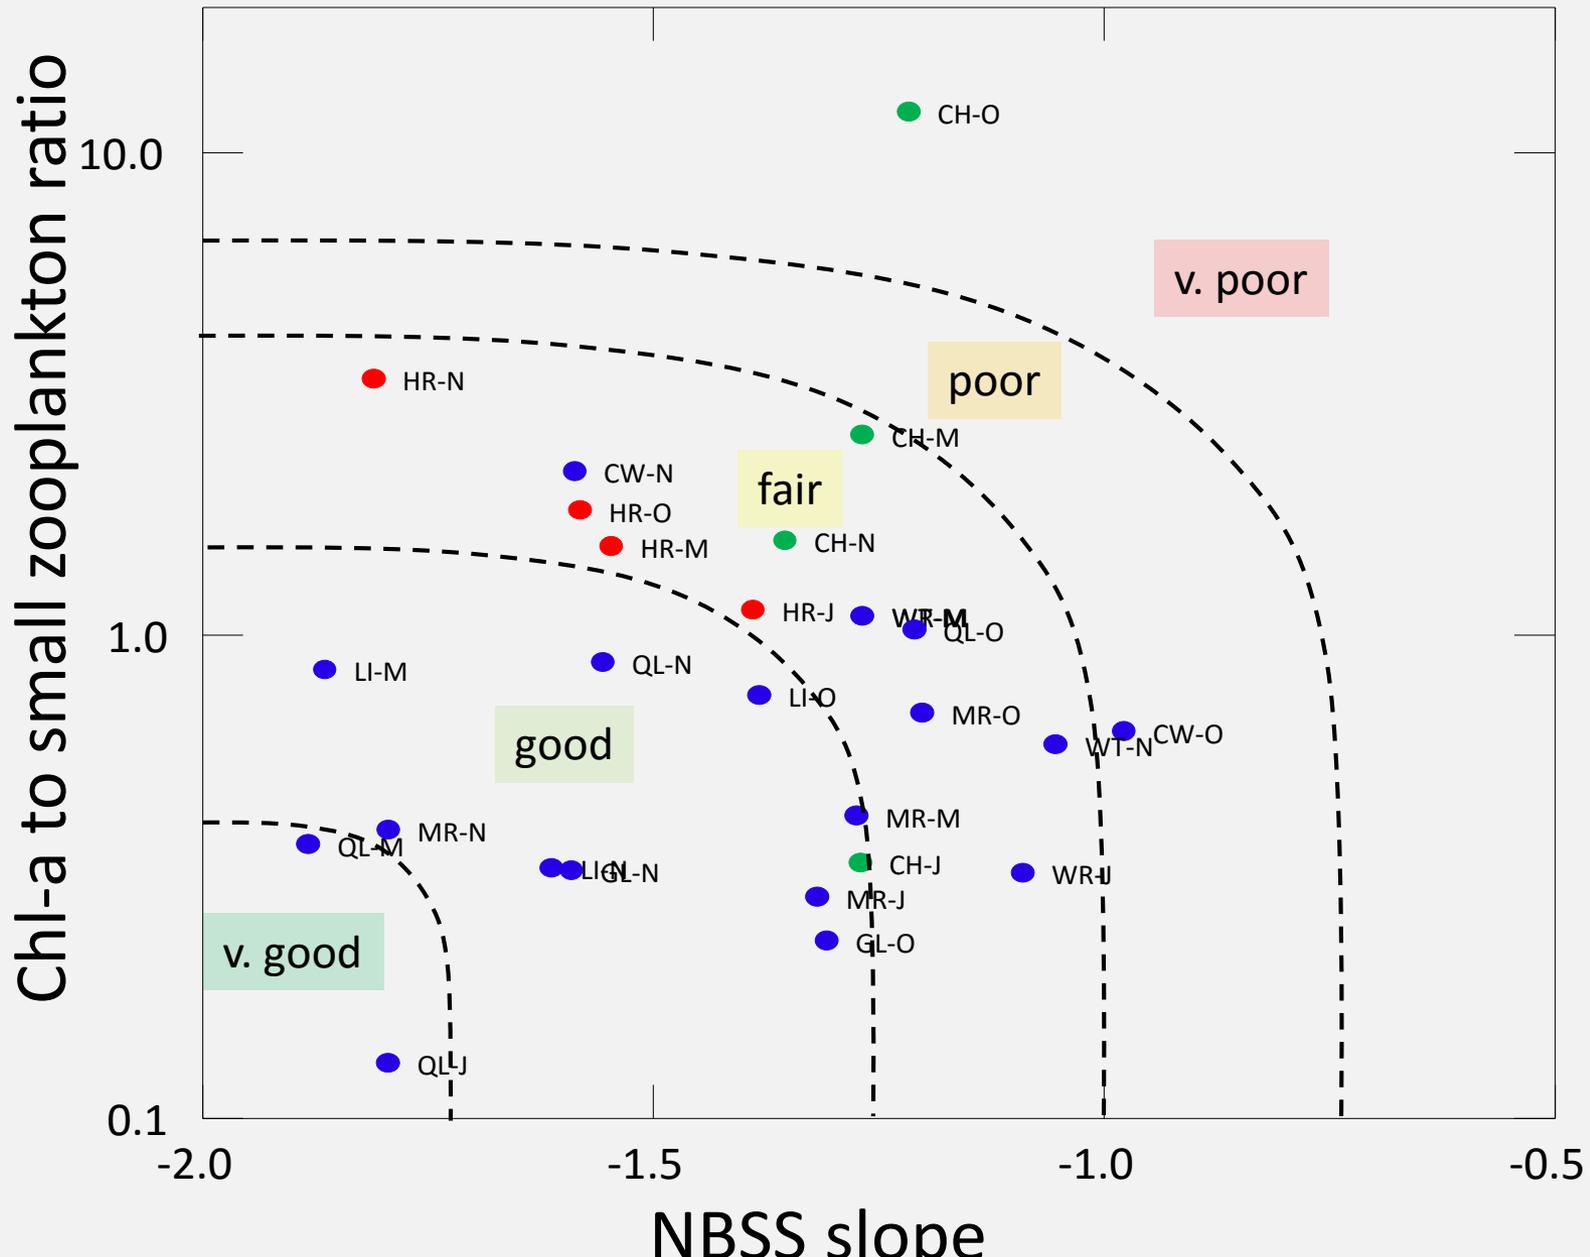

# Proposed indices of size spectra

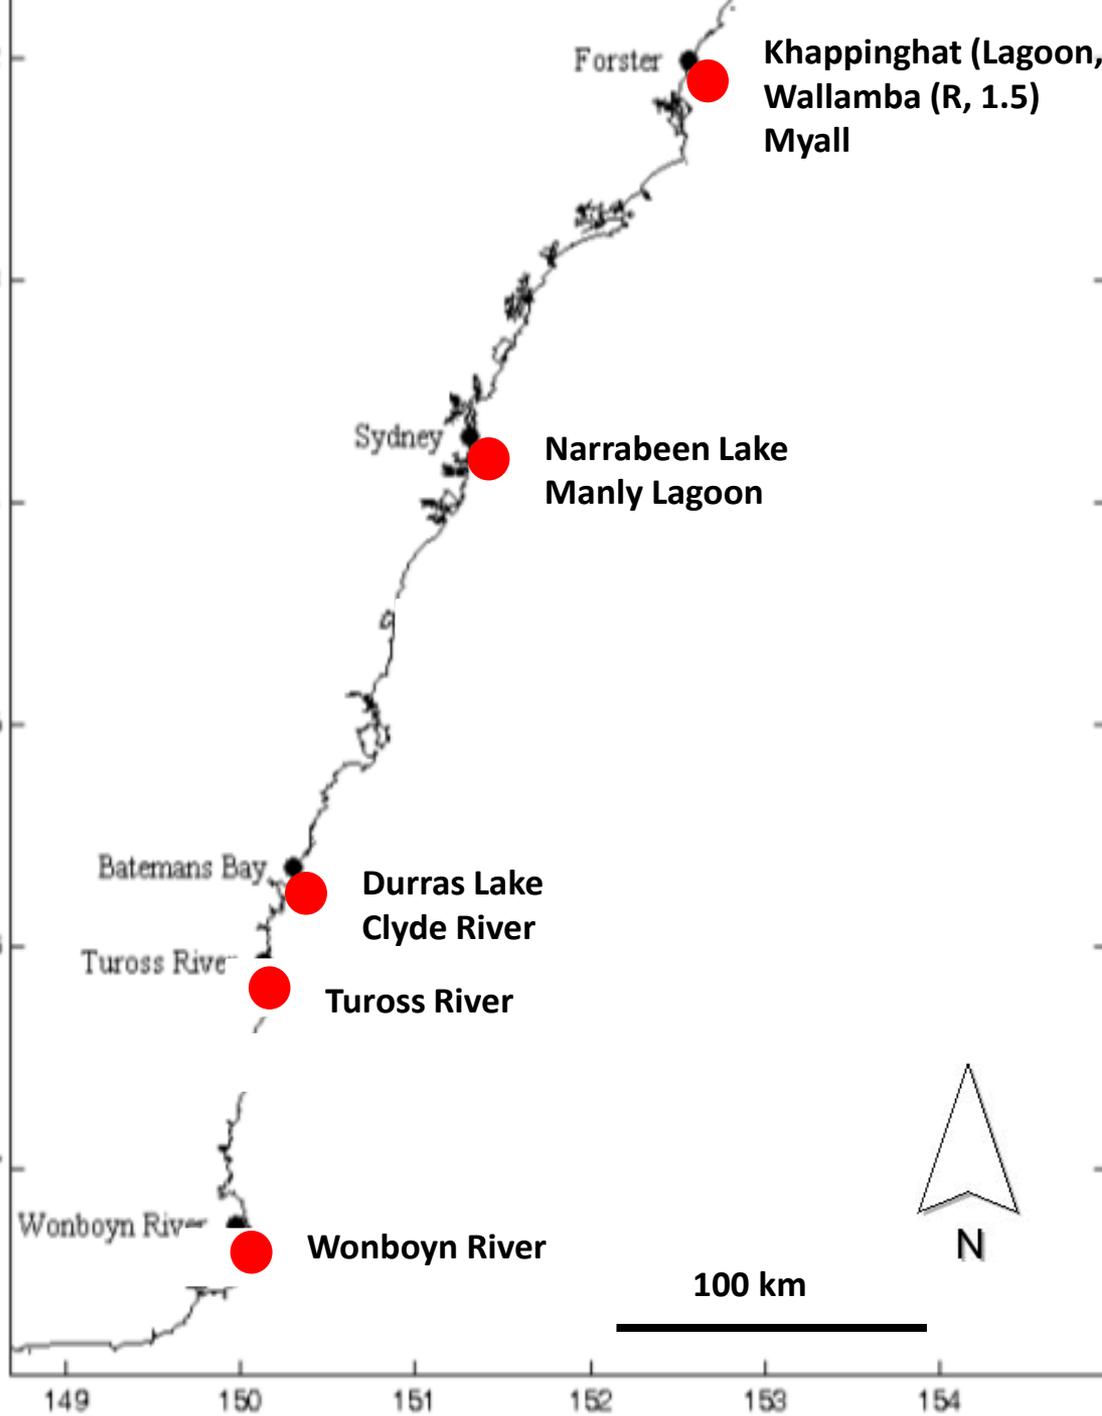

- Slope = assimilation of nutrients
  - Predation (Zhou & Huntley)
  - Steeper slope, better water quality
- [Chlorophyll-a] : small biomass ratio
  - Small ratio = good; Big ratio = eutrophic
- Or ~Geometric Mean Size ?
  - Big bugs = good; small bugs = less good

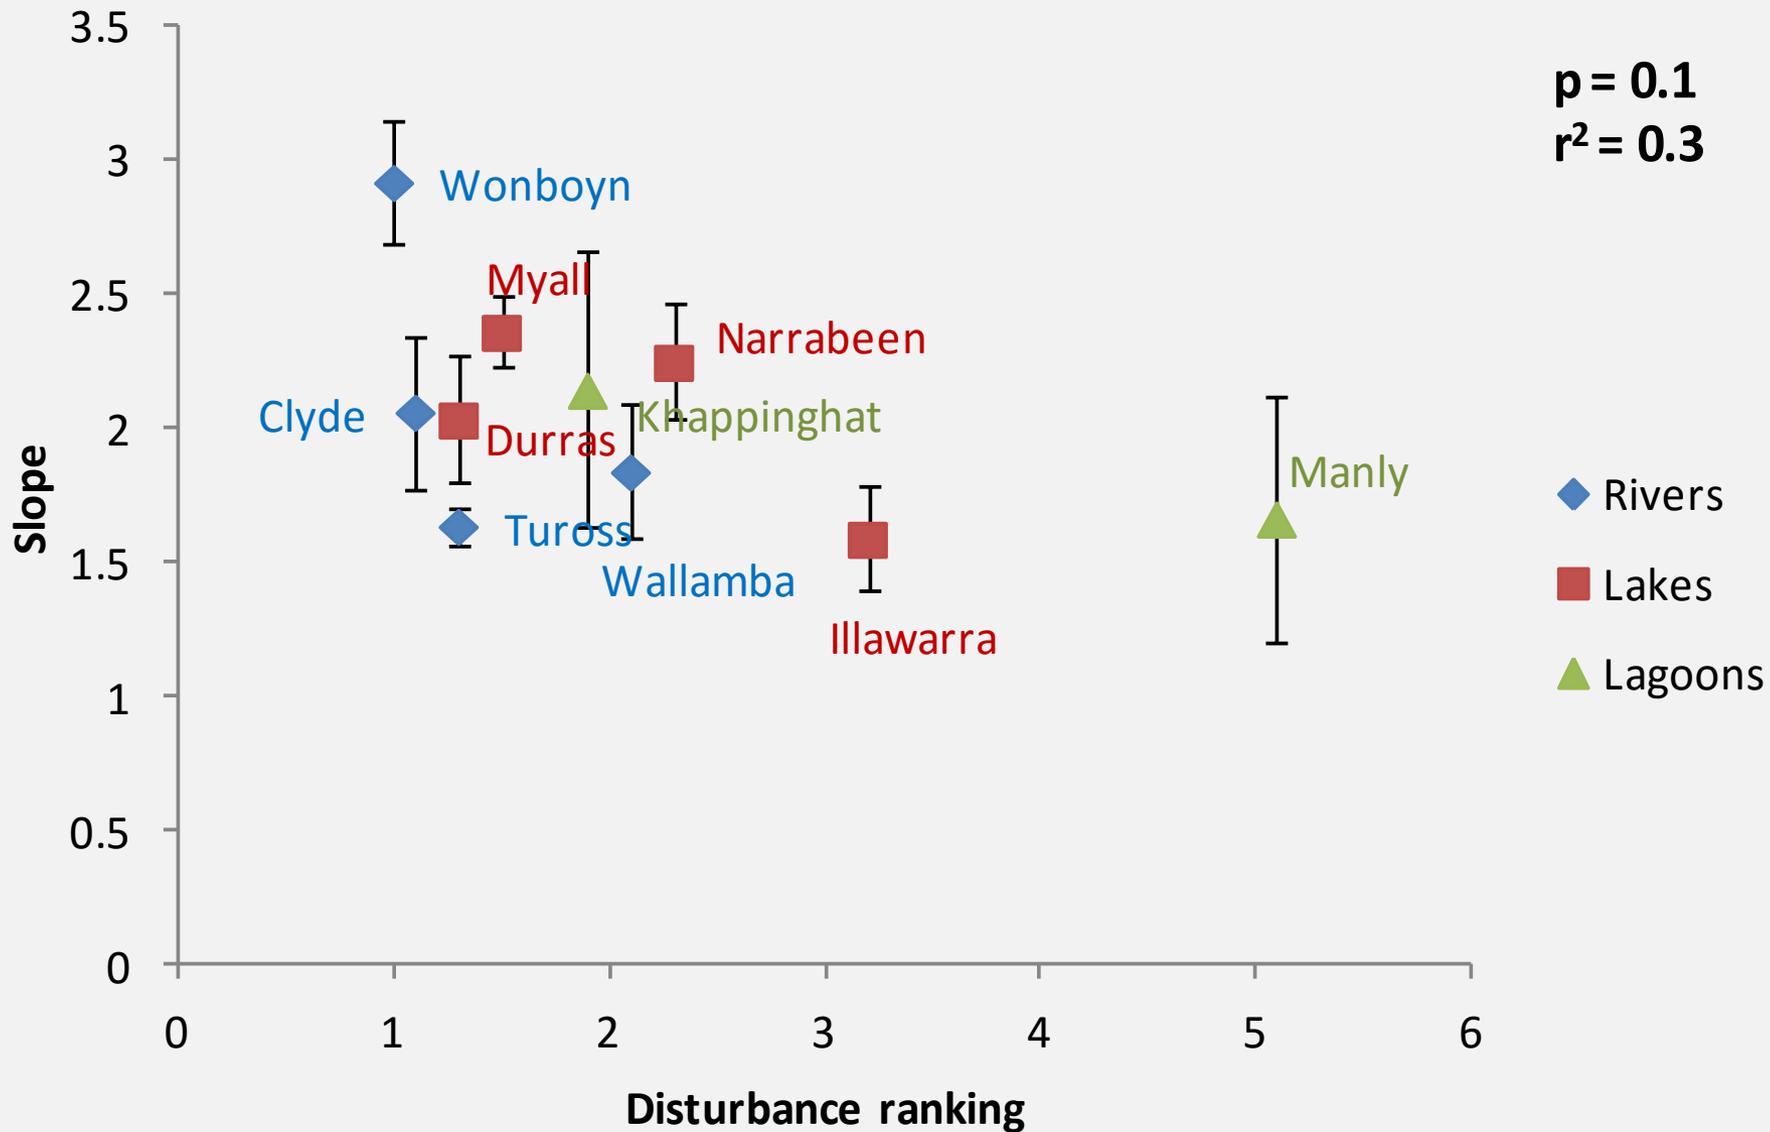

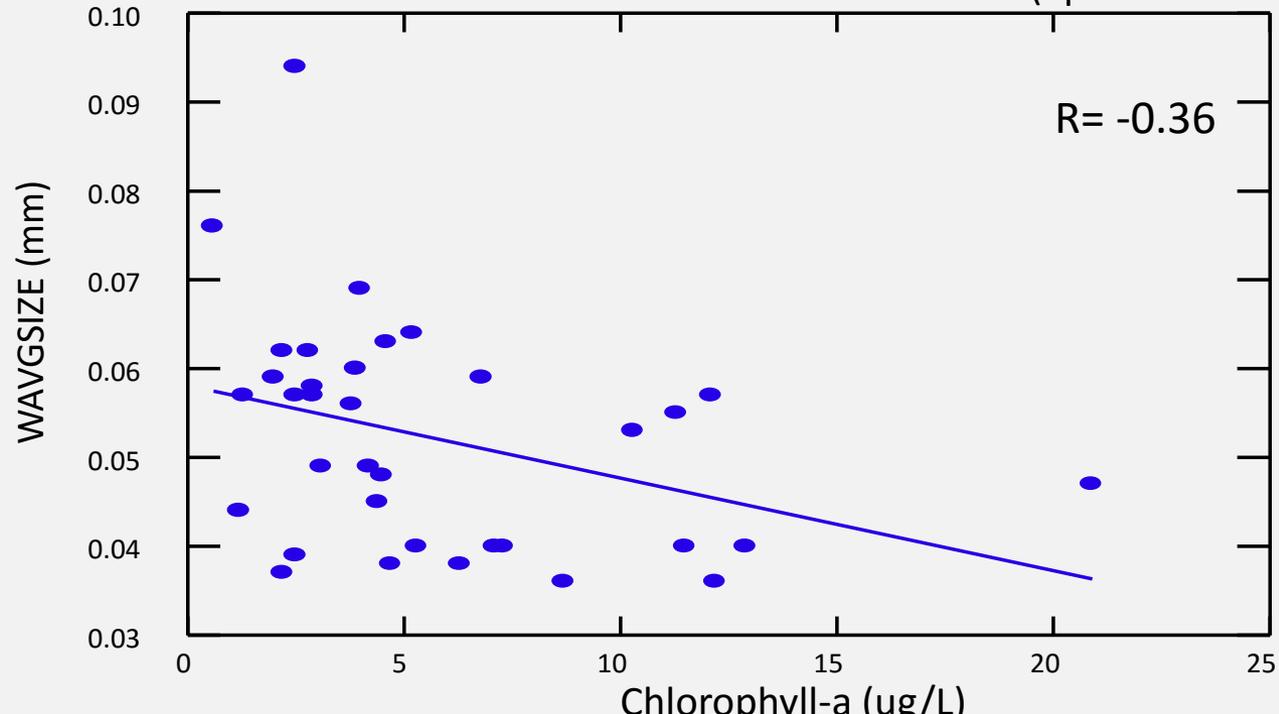

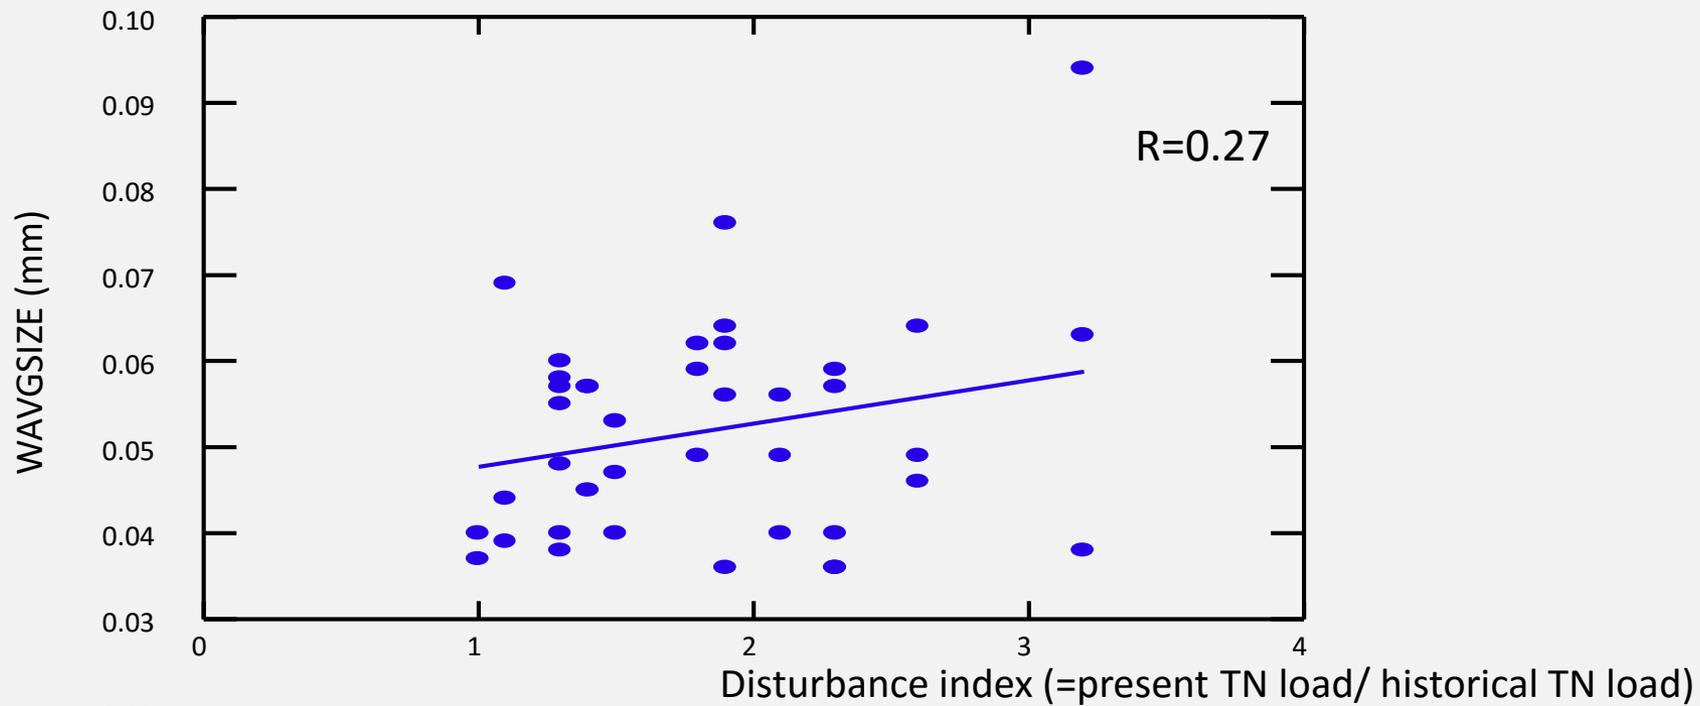

# Council requested dynamic “traffic light”

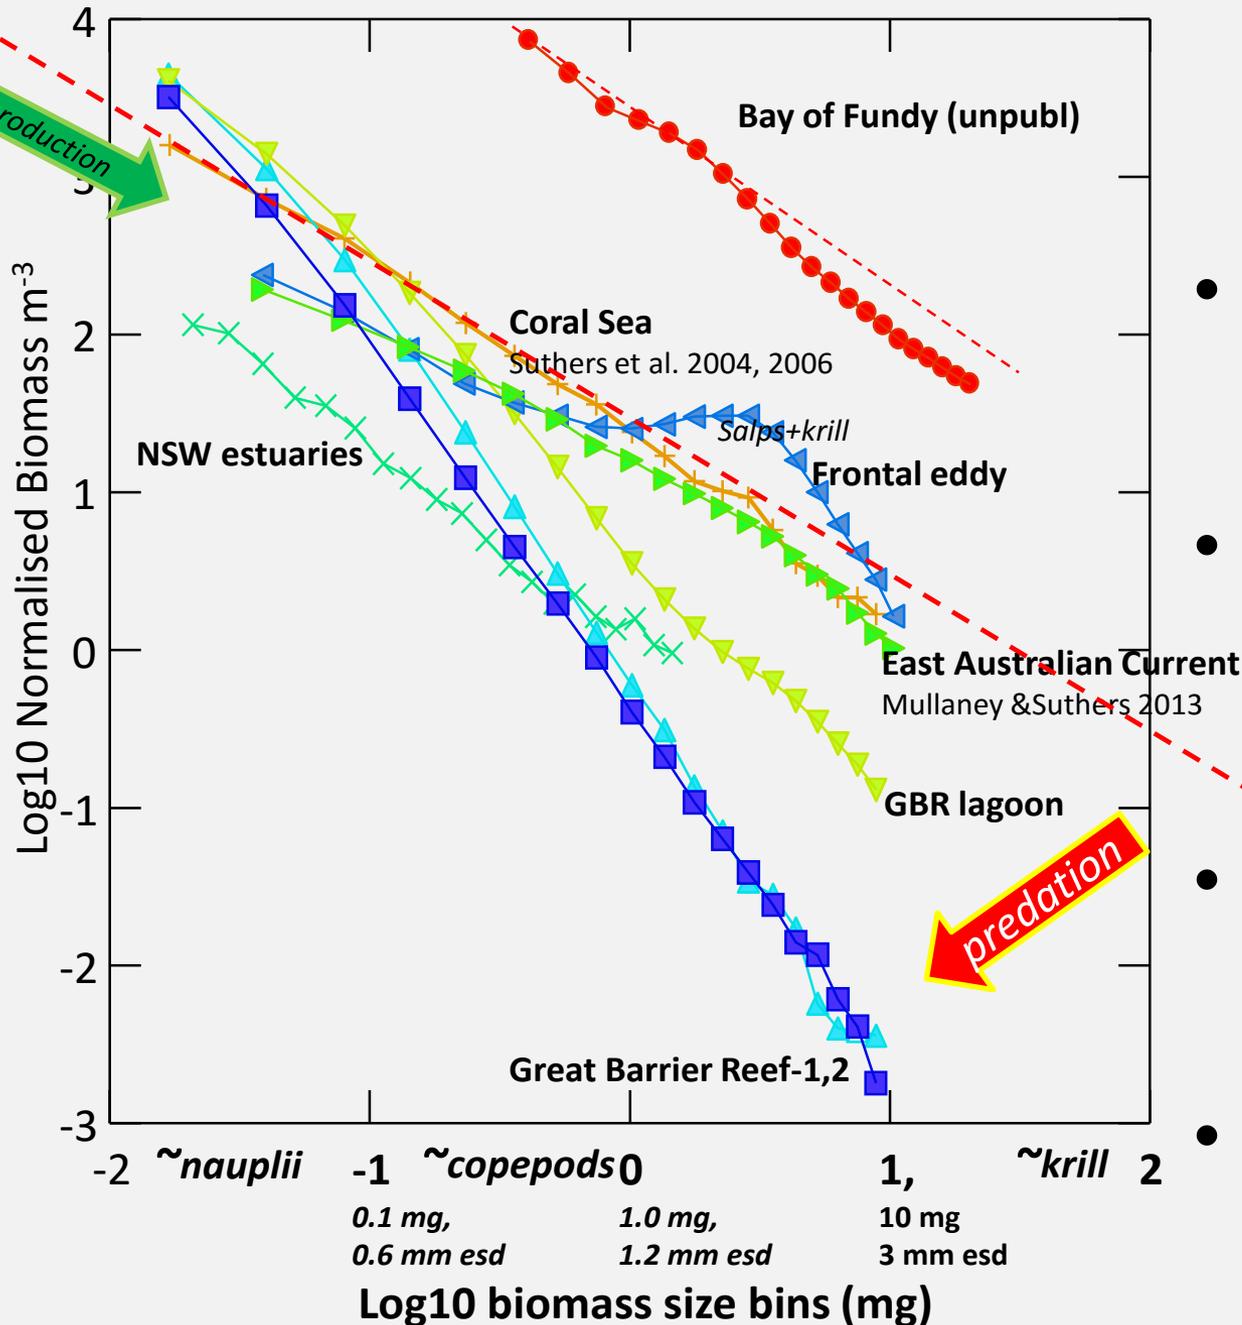

# Study sites

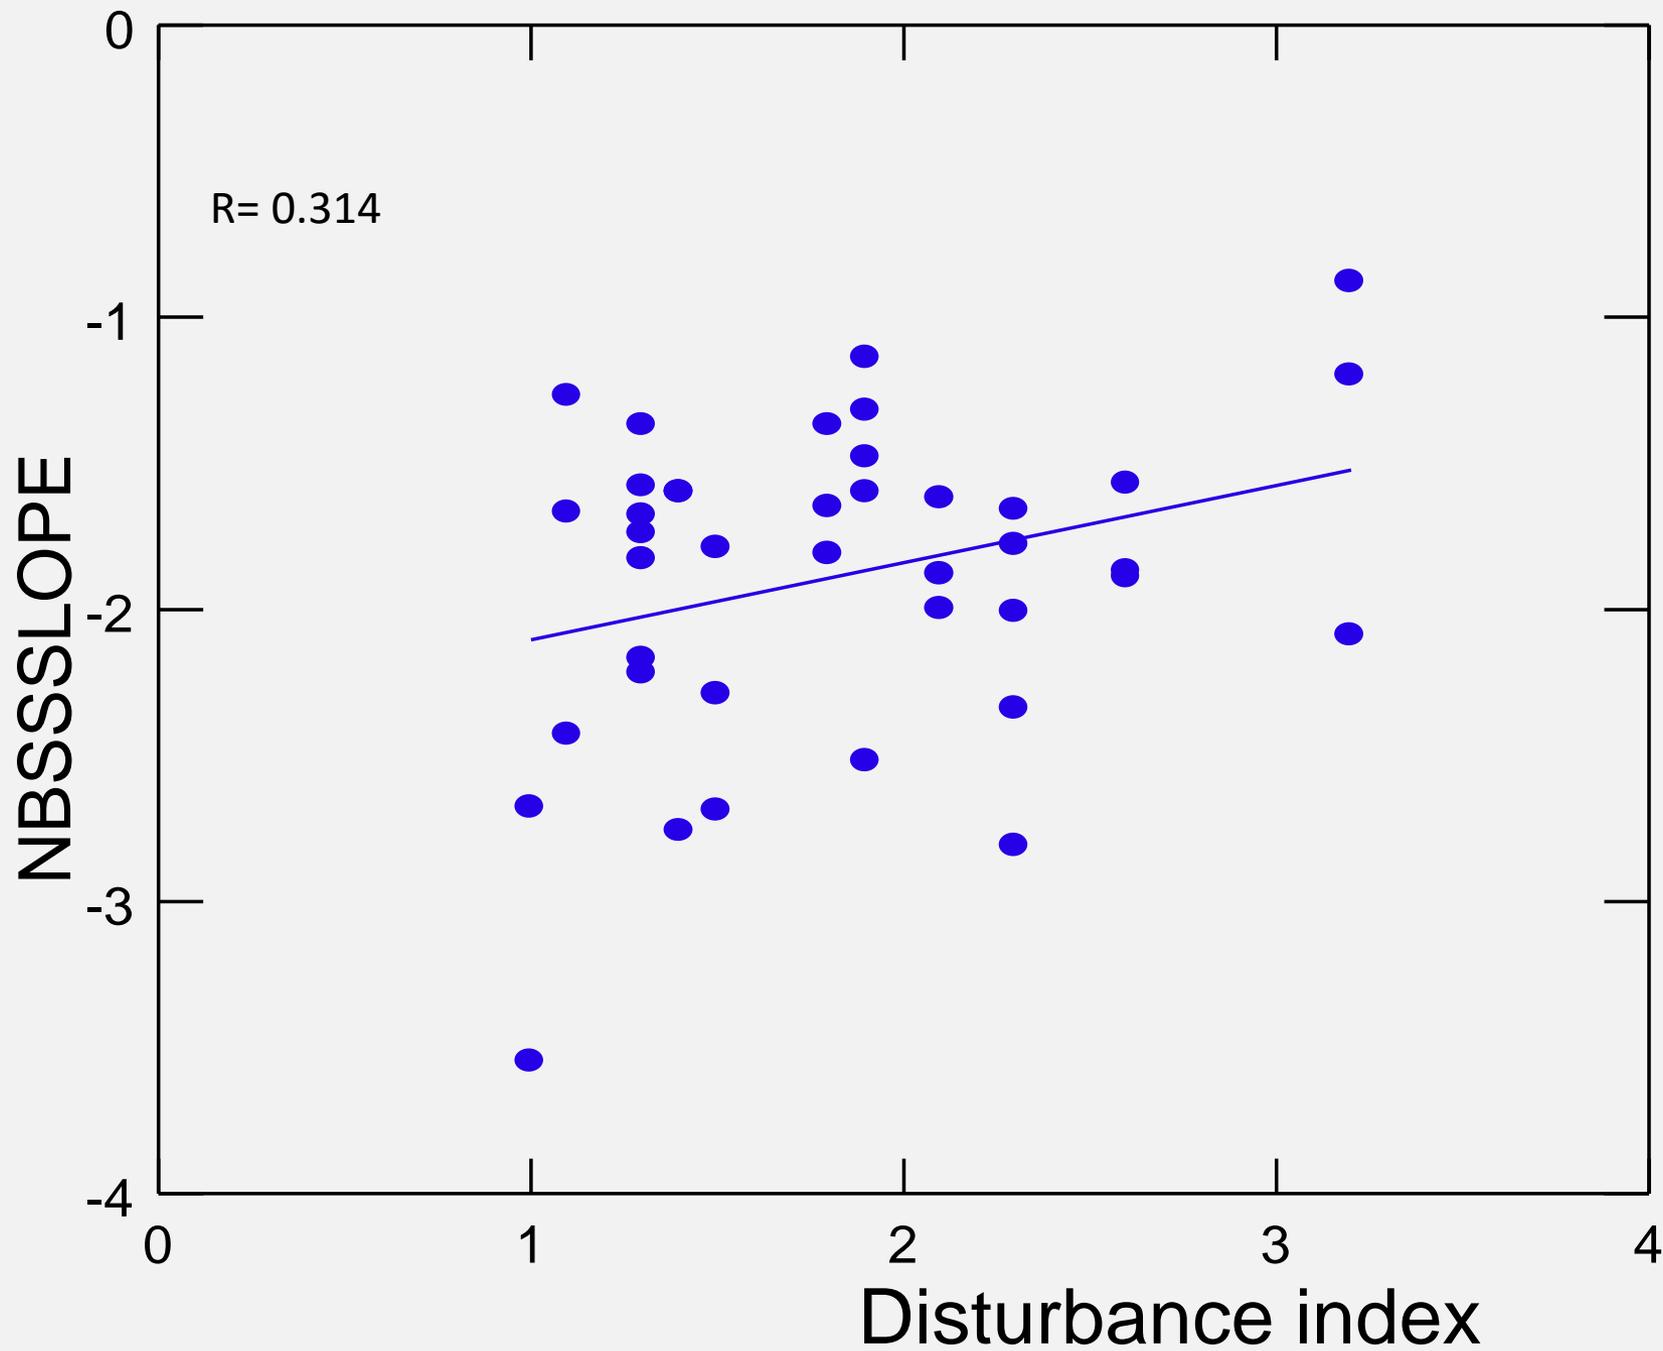

# Estuaries?

- The planktonic size-based ecosystem!
- Summarised by the size frequency distribution
- speculate on production, predation
- See Jason Everett's poster

# Conclusion & discussion points:

- In situ counters vs. net samples
  - Coincidence from  $\ll 100$   $\mu\text{m}$  particles
  - Nets are better for estuarine samples
- Detritus and arbitrary  $<10\%$  threshold ?
- Difficulty of perfect flow meter data ?
  - Slope is independent of volume filtered
  - Also Geometric Mean Size (GMS)
- Slope (assimilation, predation) and GMS, (small-biomass:Chl-a ratio?) as useful indices

[https://en.wikipedia.org/wiki/Camden\\_Haven](https://en.wikipedia.org/wiki/Camden_Haven)

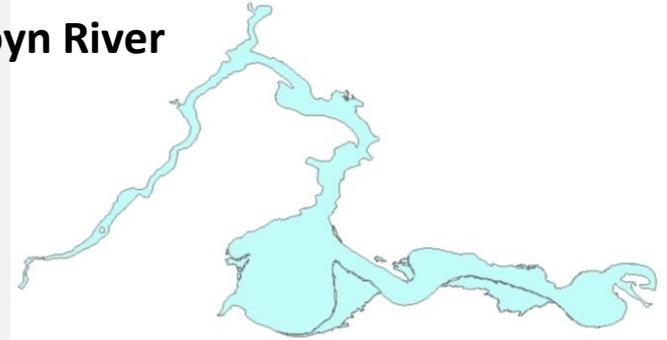

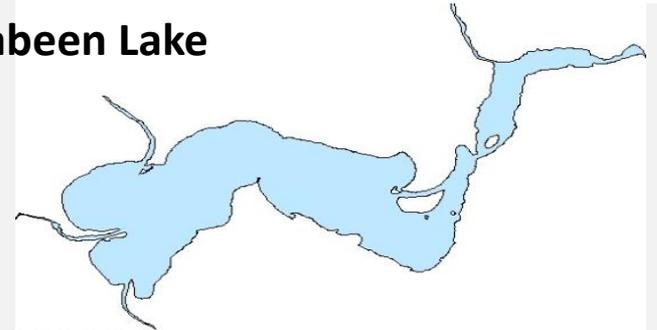

# Rivers, Lakes, Lagoon

- Geomorphology of estuaries (Roy et al. 2001)
  - Rivers frequently flushed (Roper et al. 2011)
  - Lakes high dilution but less tide
  - Lagoons – smaller, shallower and lower dilution

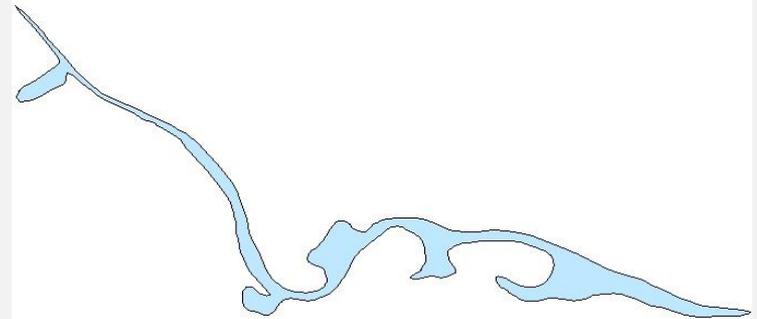

Wonboyn River

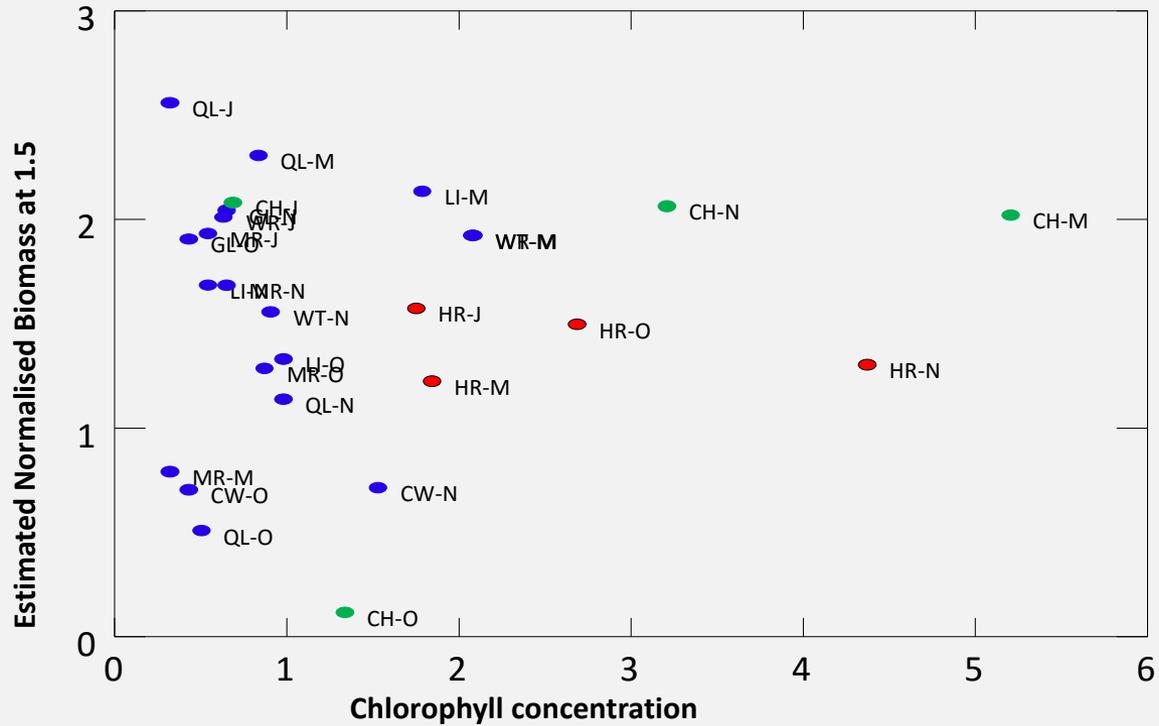

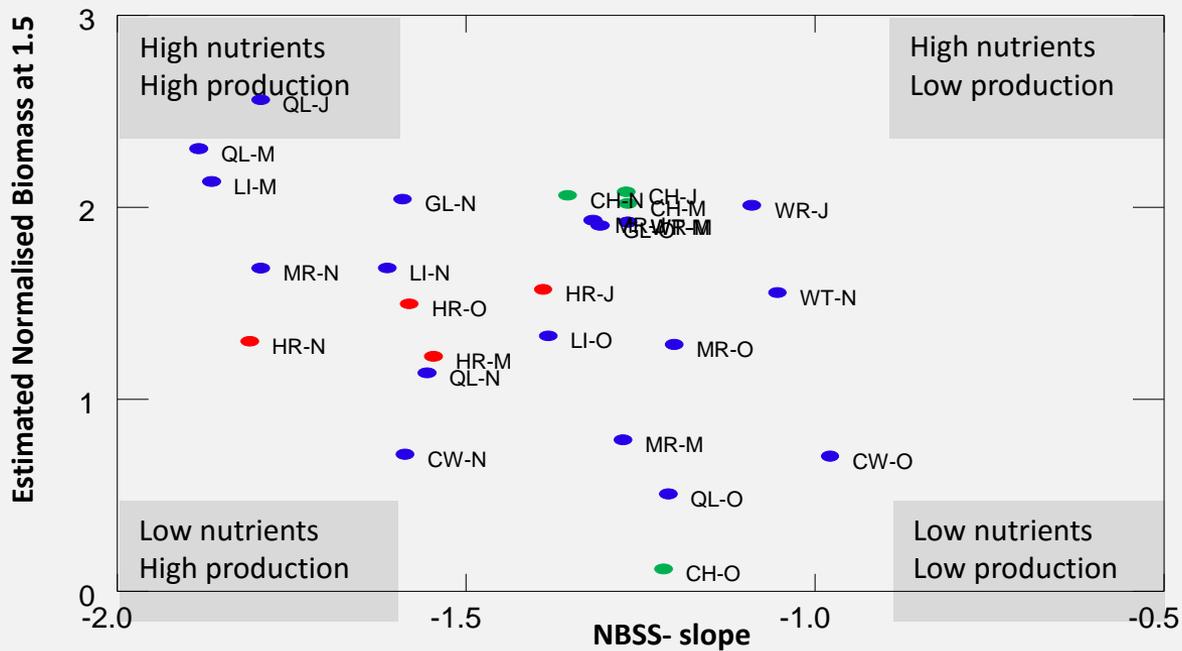

Narrabeen Lake

Manly Lagoon

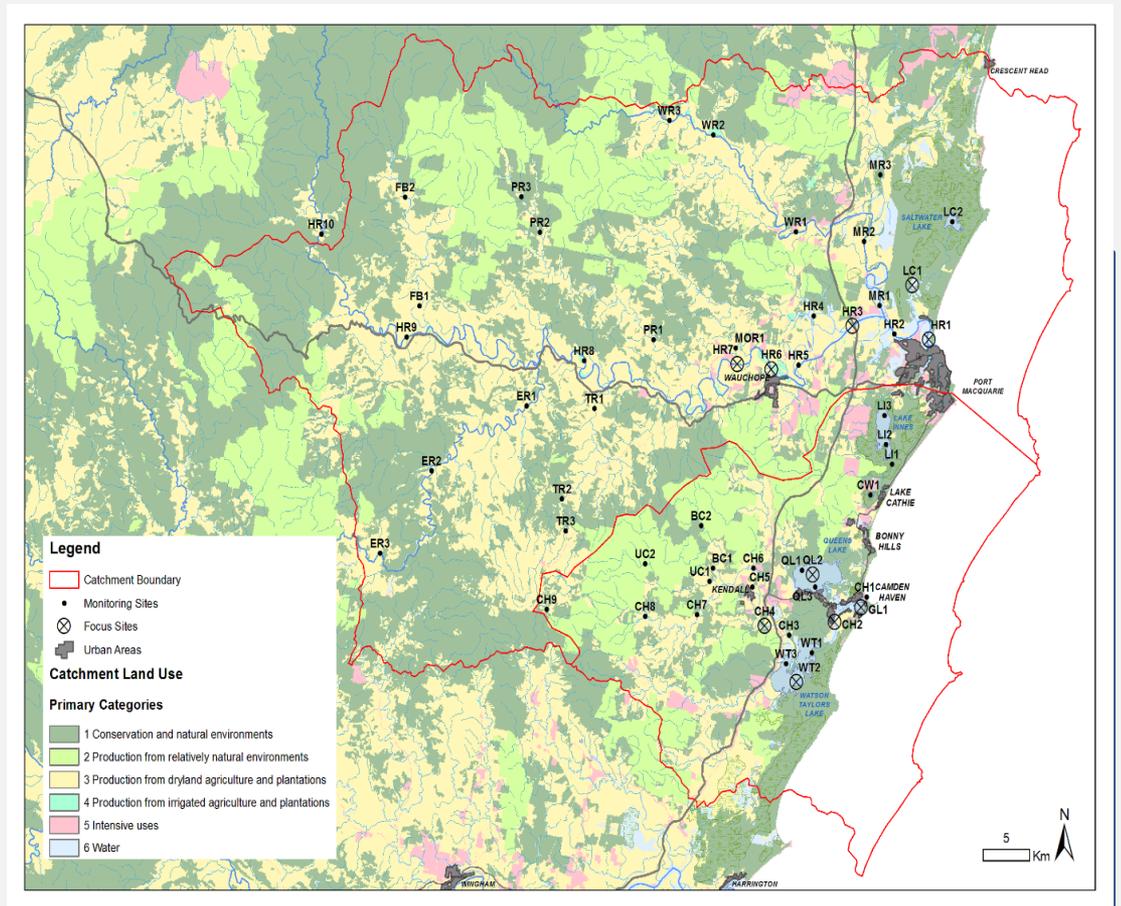

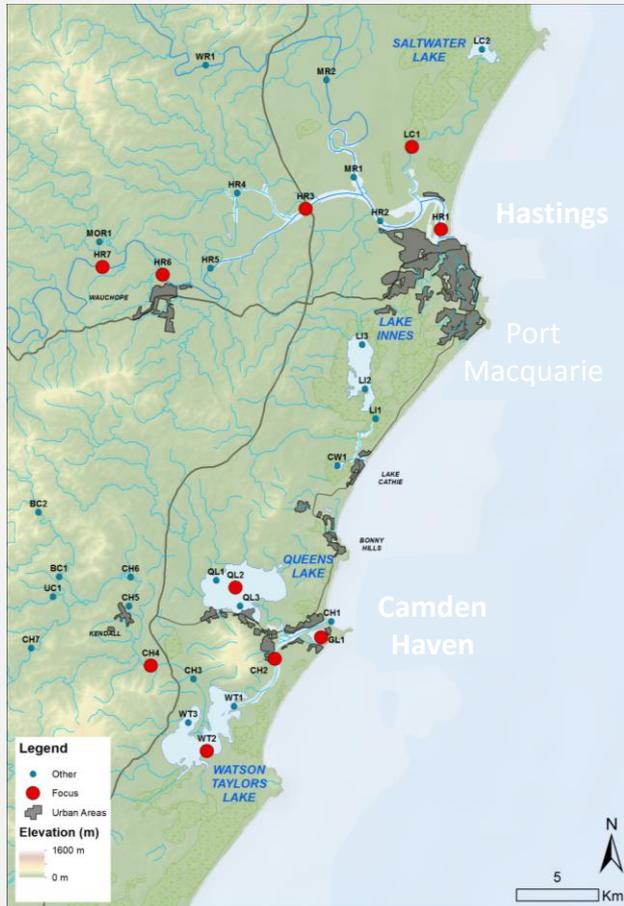

<u>rank</u>	<u>Score</u>	<u>Chl : sm</u>	<u>slope</u>
v good	5	<0.5	>1.75
good	4	0.5 to 1.5	1.25 to 1.75
fair	3	1.5 to 3	1 to 1.25
poor	2	3 to 5	0.75 to 1
v. poor	1	>5	<0.75

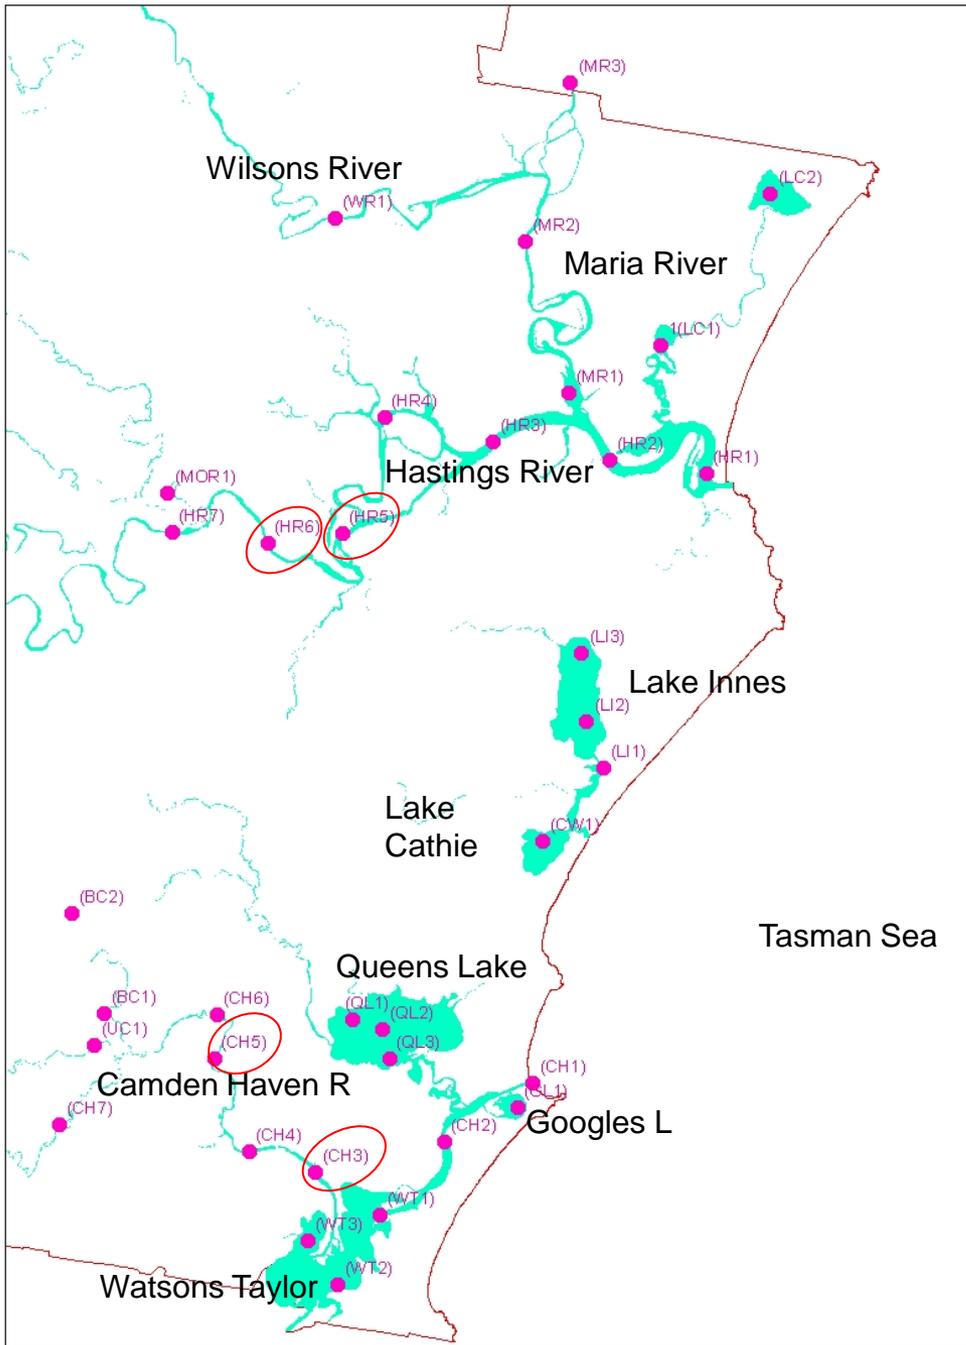

<u>rank</u>	<u>Range</u>
v good	>4.2 to 5
good	>3.4-4.2
fair	>2.6-3.4
poor	>1.8 to 2.6
v. poor	<=1.8

Change this to GMS and slopes

# Sample Locations & Variables

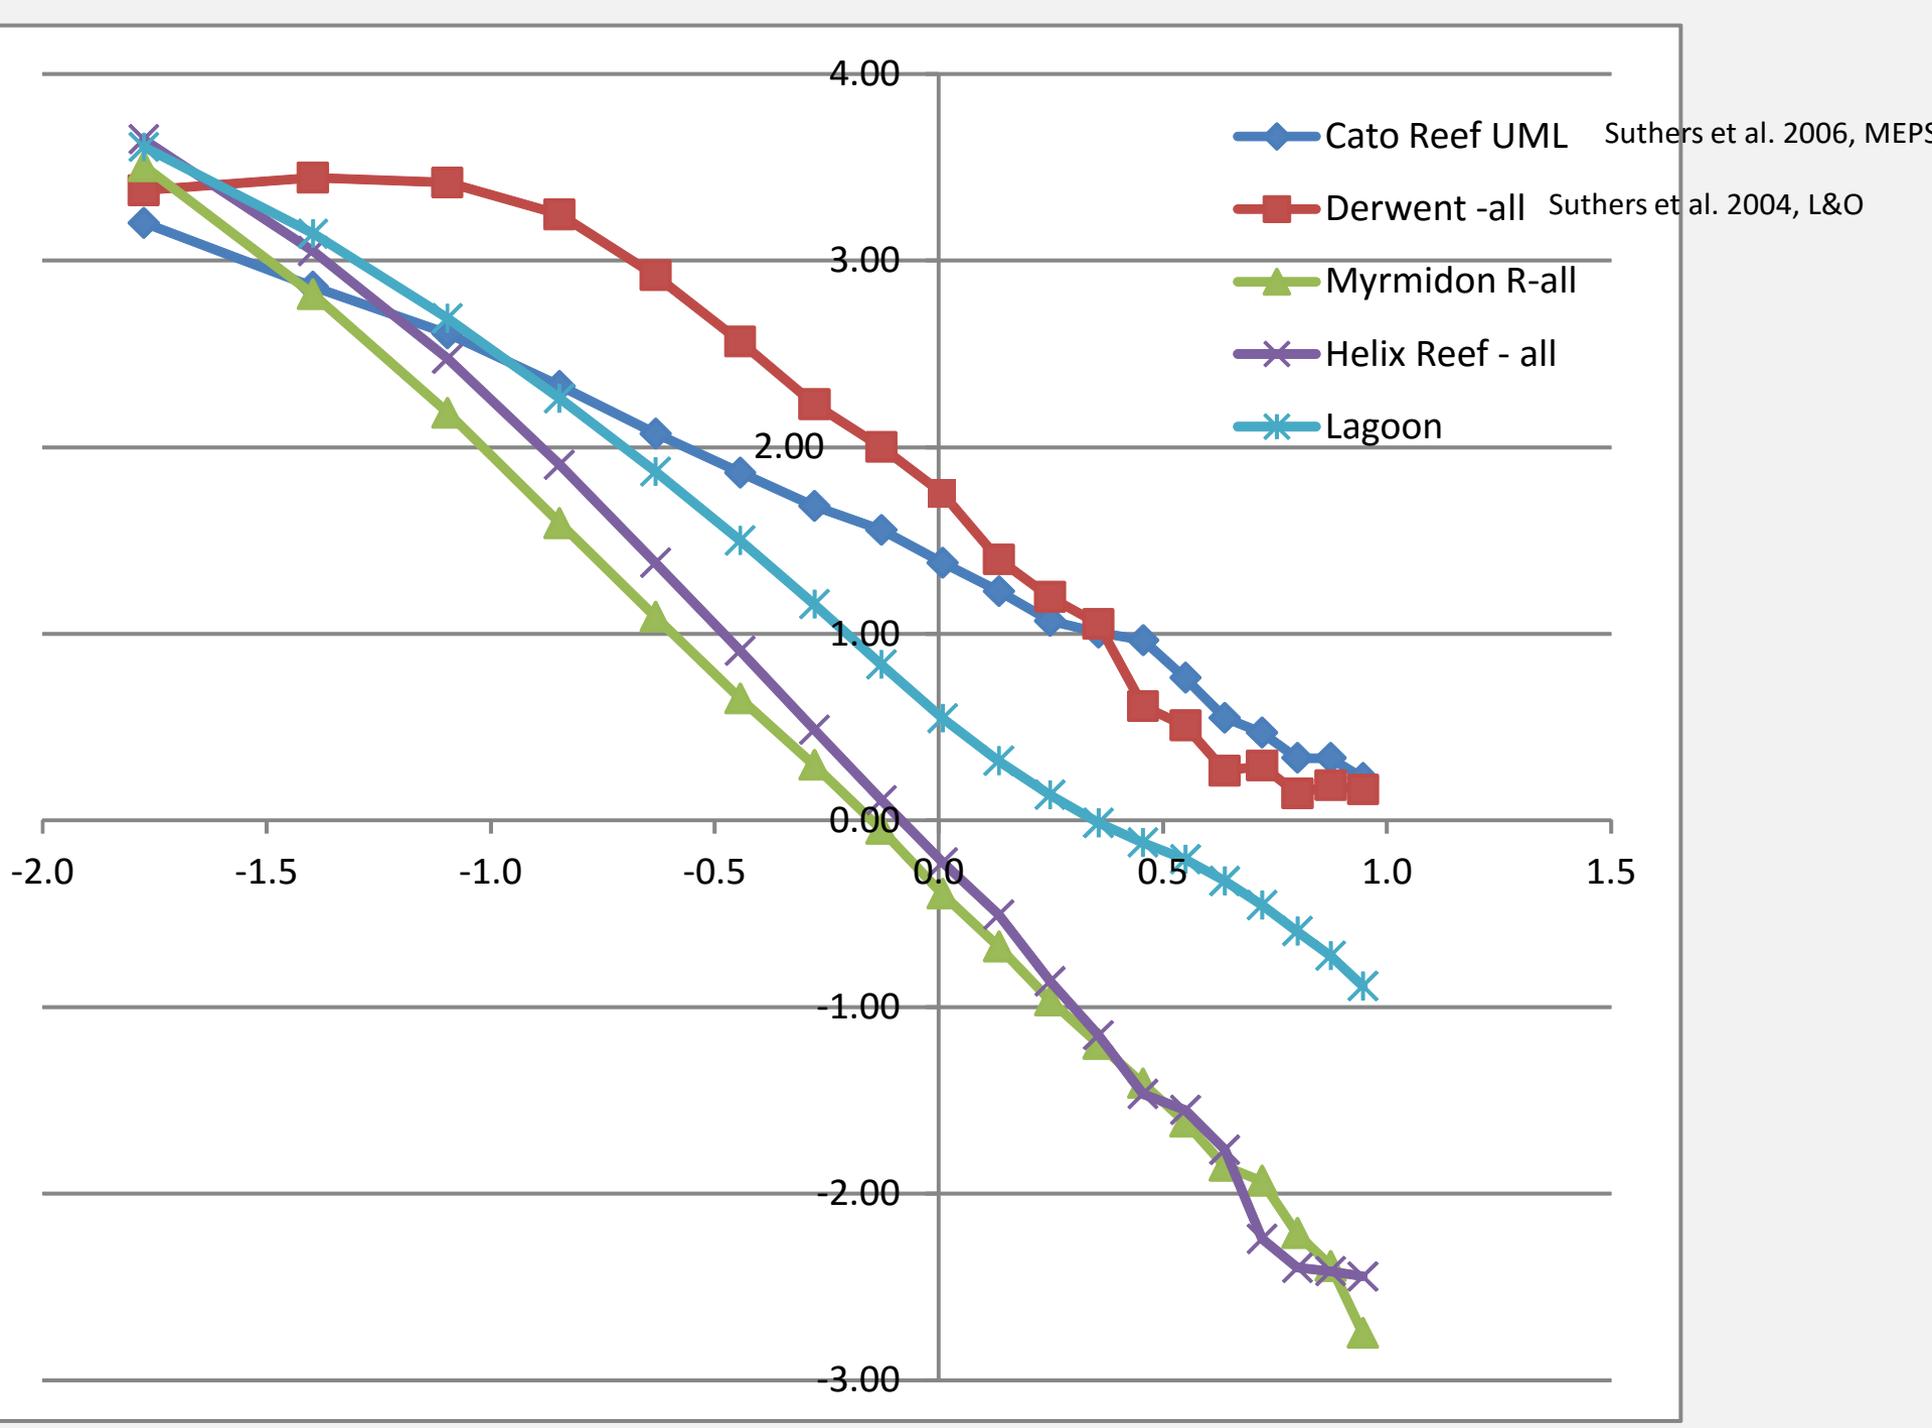

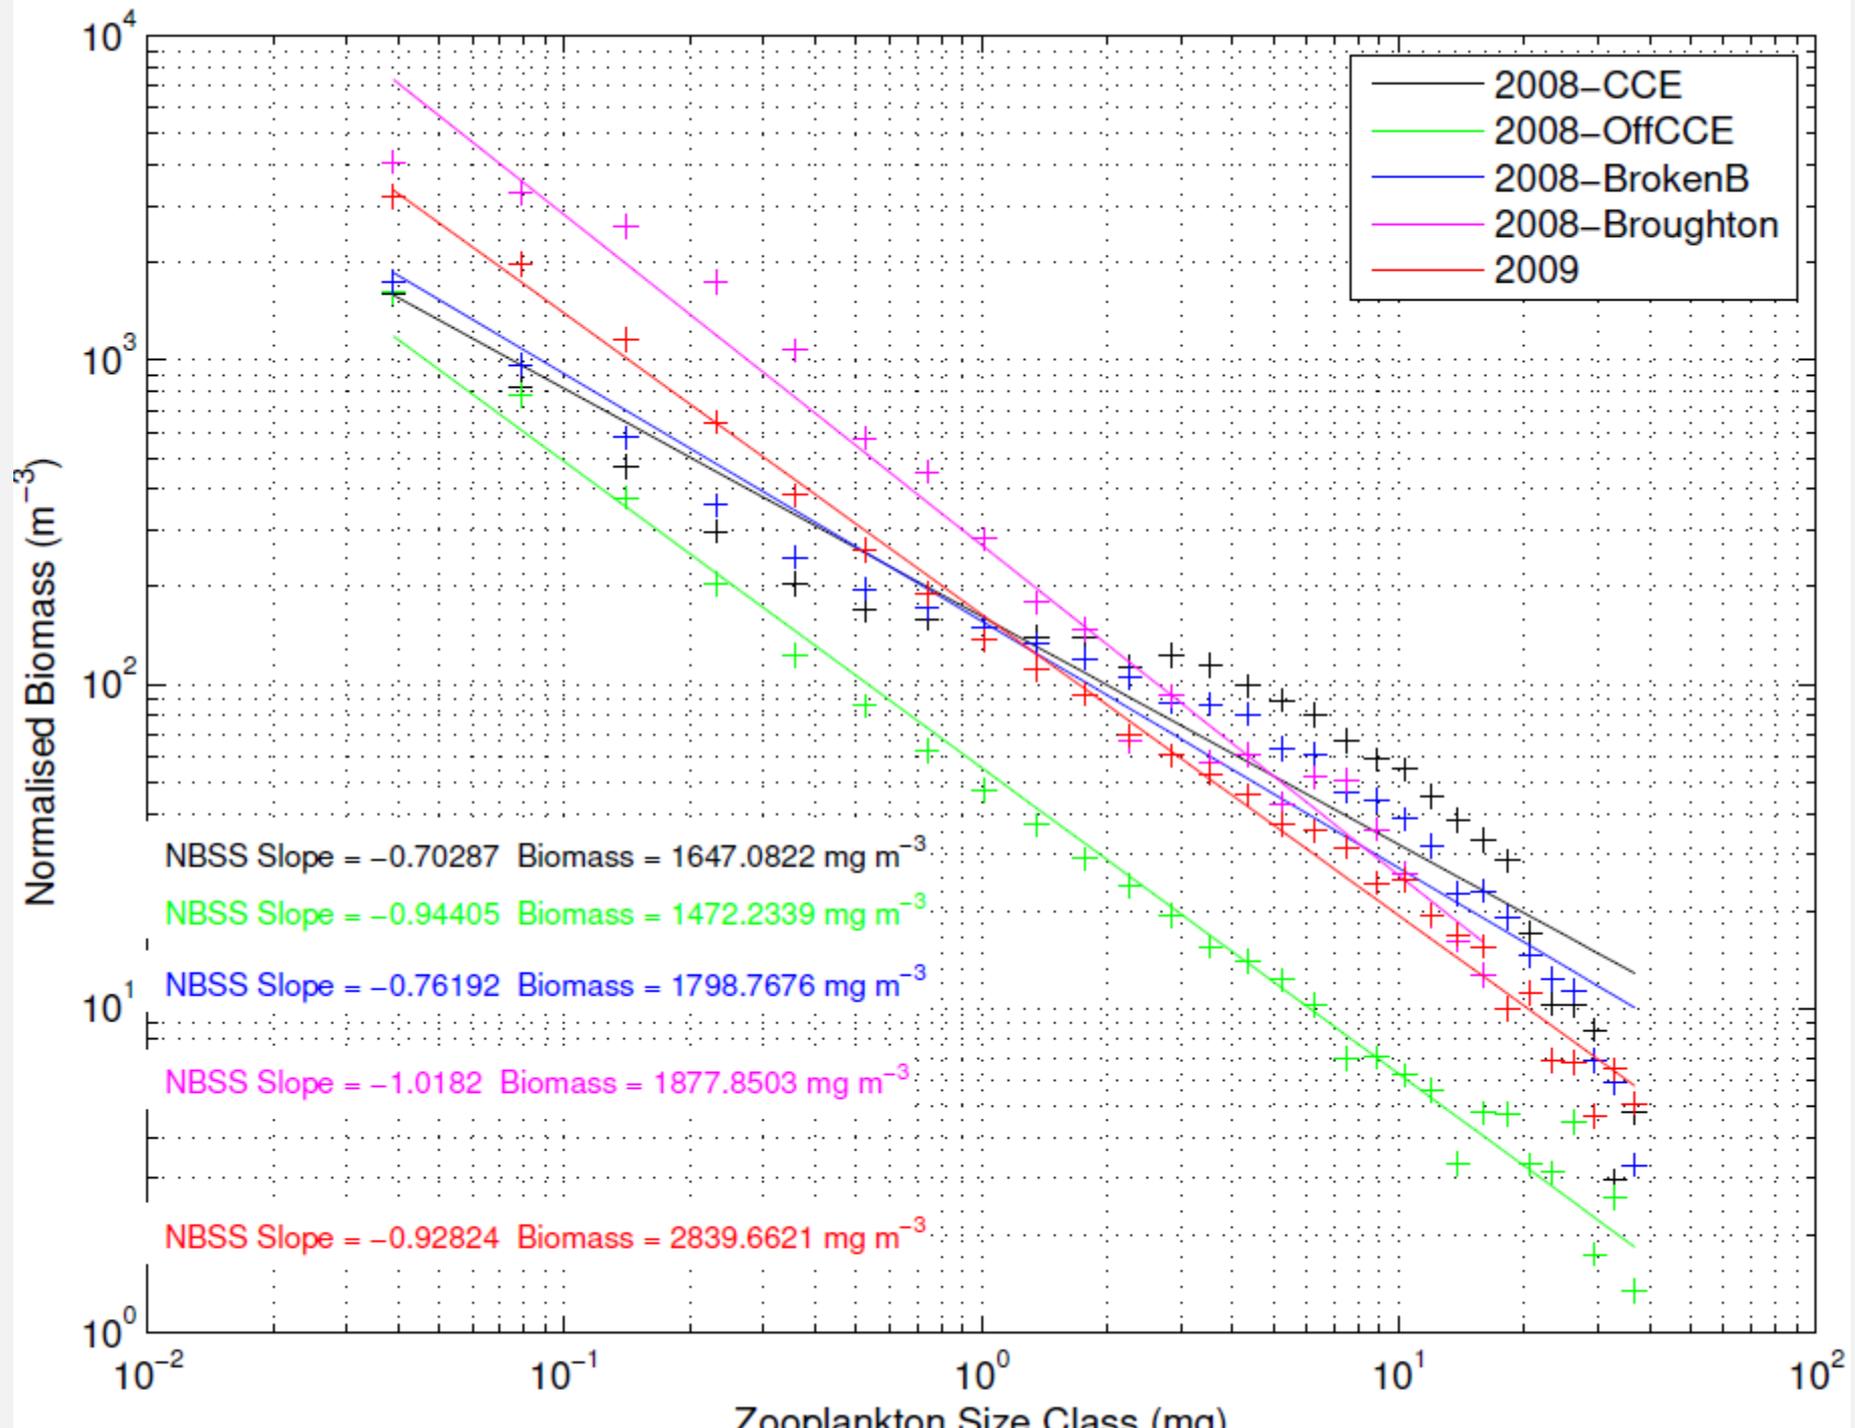

FTB1

FTB1

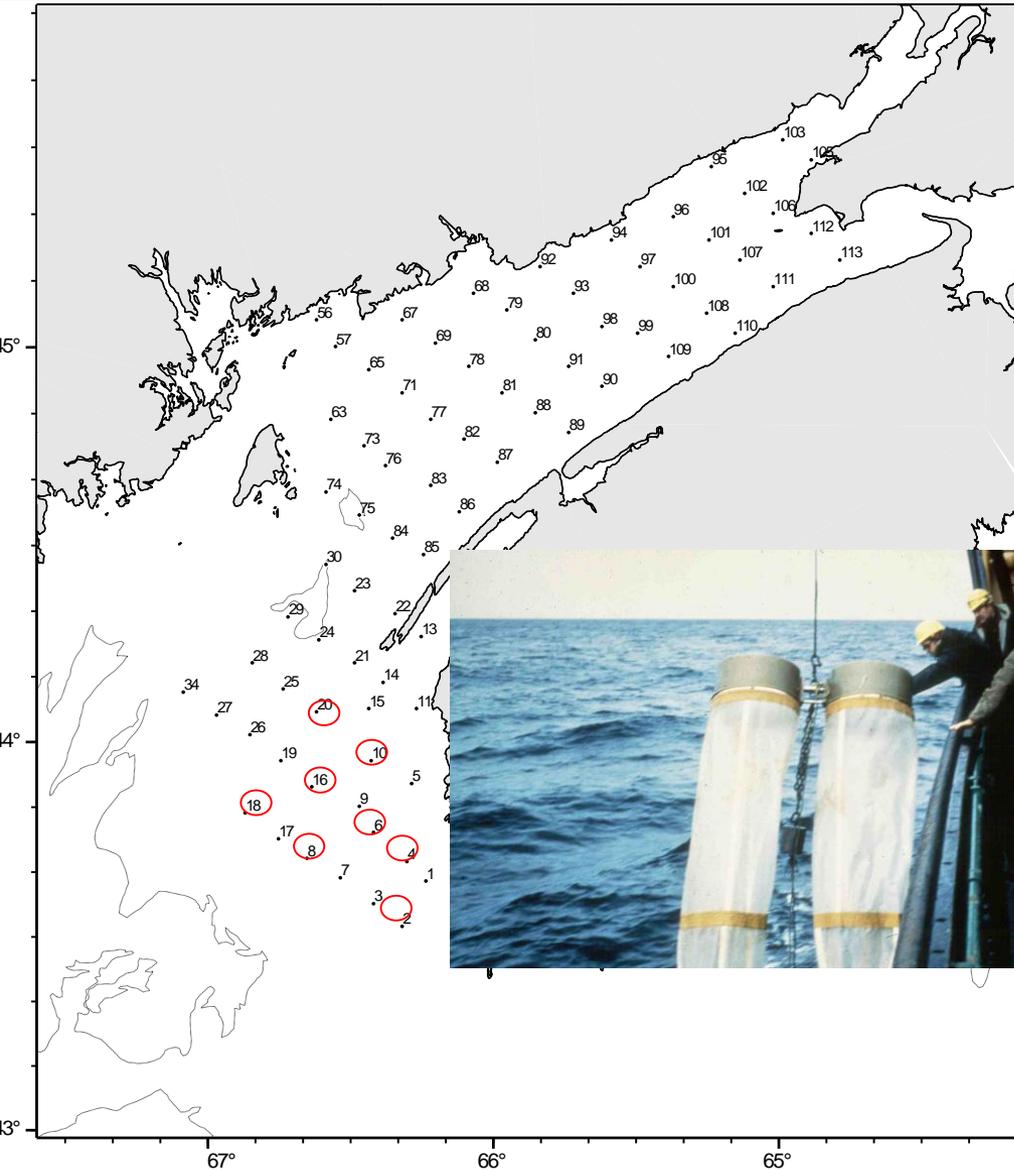

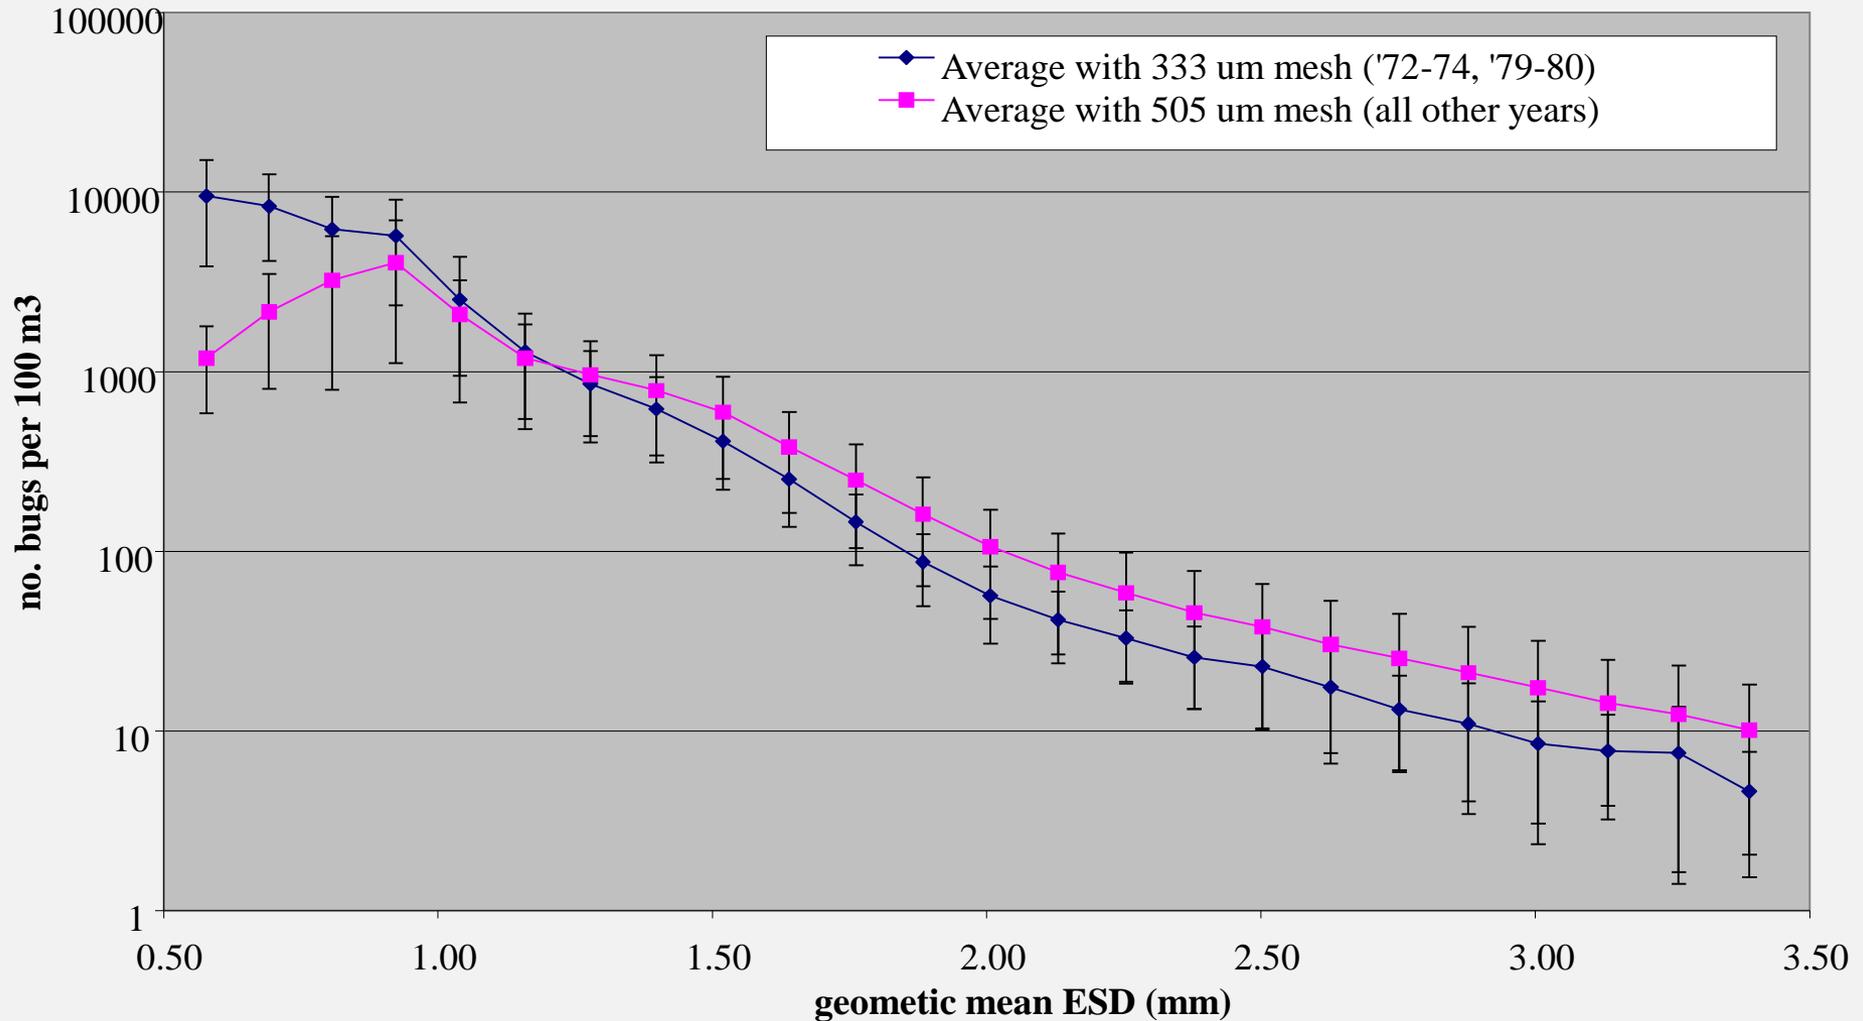

# Plankton surveys Bay of Fundy:

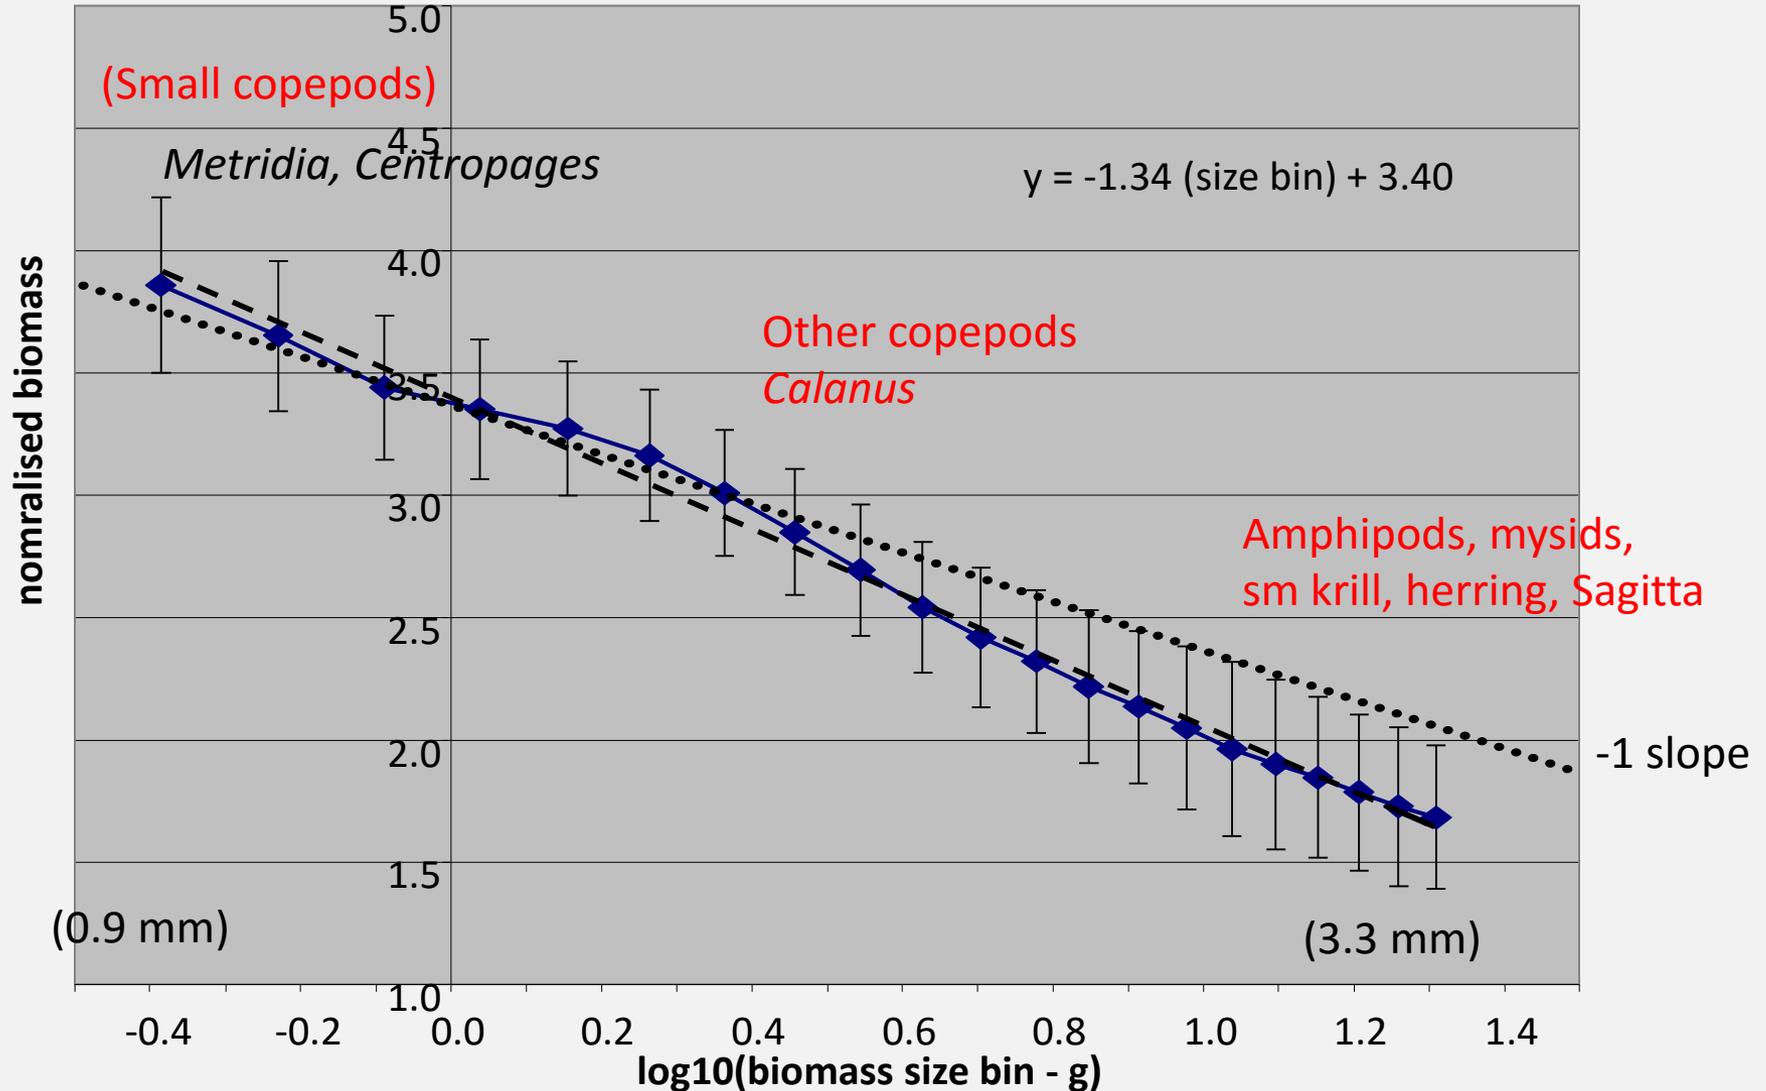

- First week of November
  - 1972-1998
- Bongo, 0.5 mm, ~500 m<sup>3</sup>
- Zooplankton
  - Atlantic Refr. Collection
  - beautifully archived + 14 taxa abund. categ. 0, <10, <100, <1000, >1000
  - OPC 8 core stations x 27 years, '72-'98

# Comparison of 333 and 505 $\mu\text{m}$ mesh

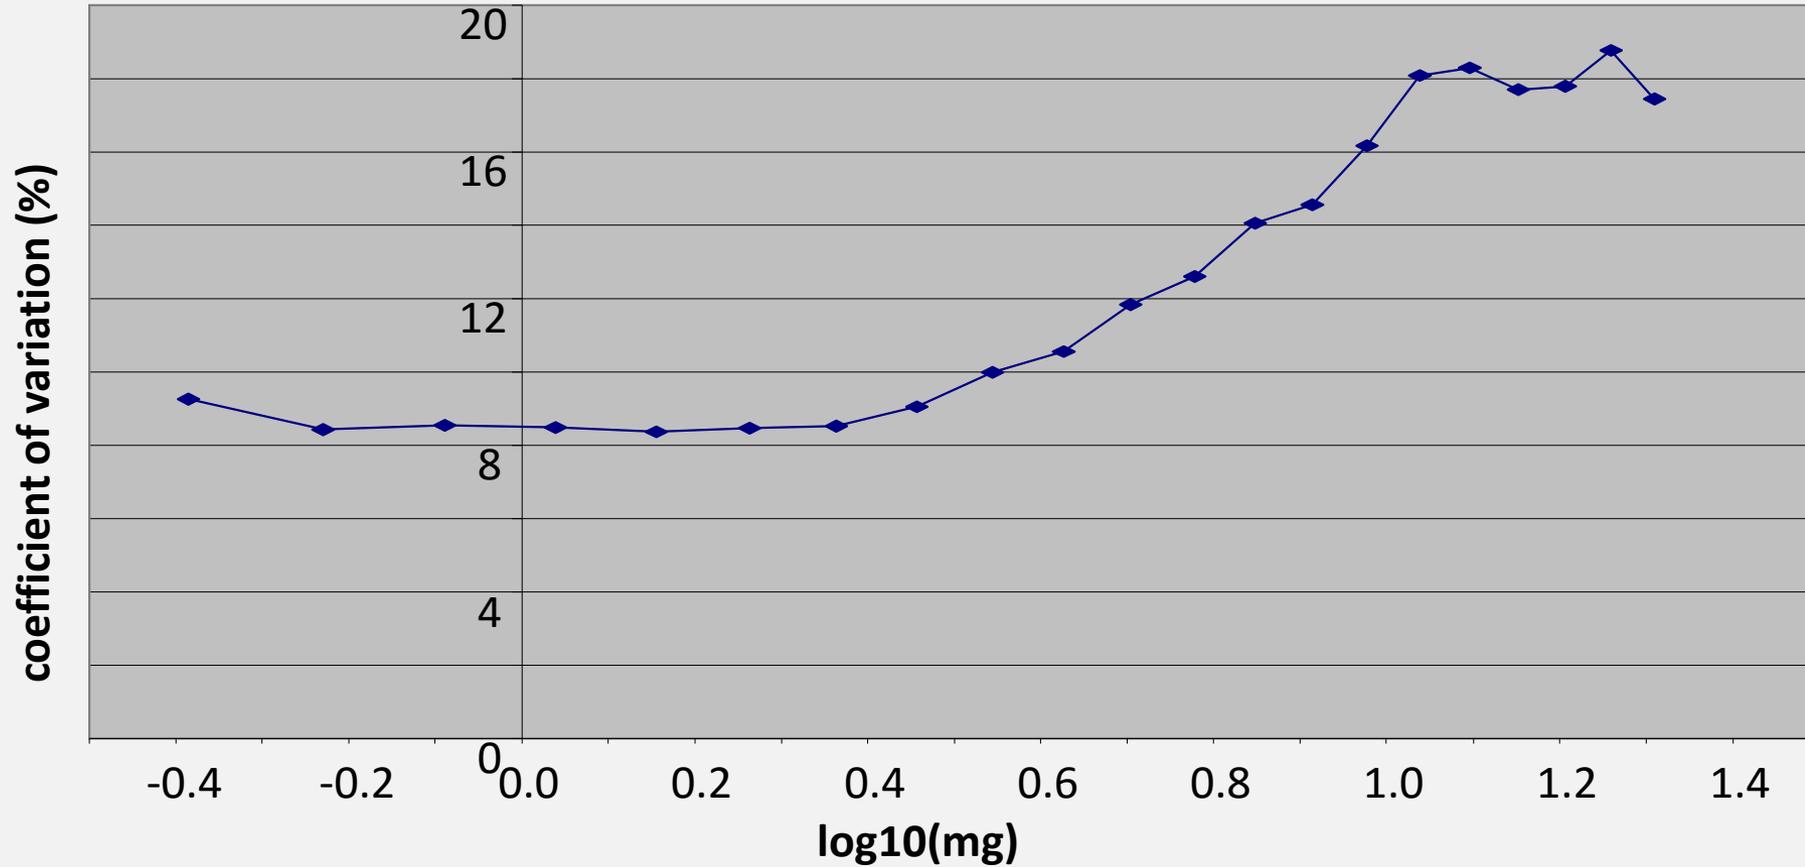

# Bay of Fundy, 1972-1998 archive

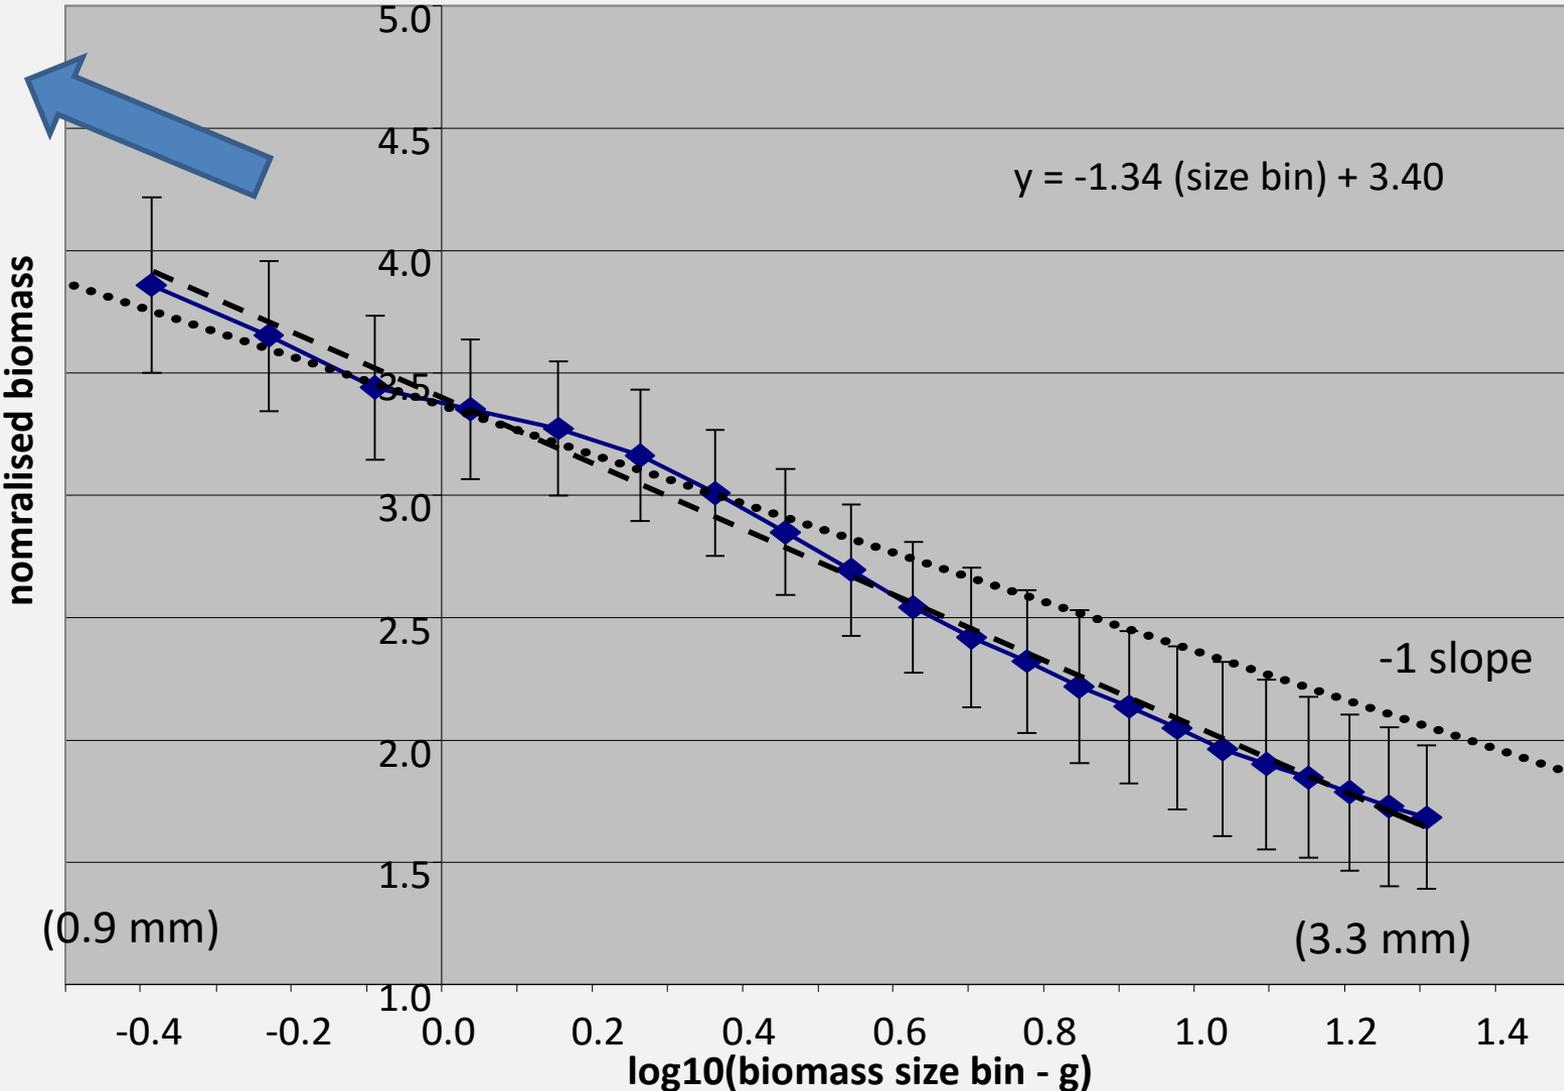

# Coefficient of Variation

## Effect of predation:

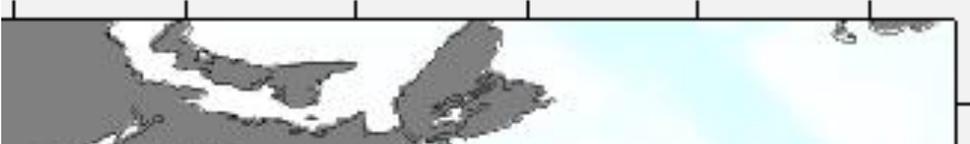

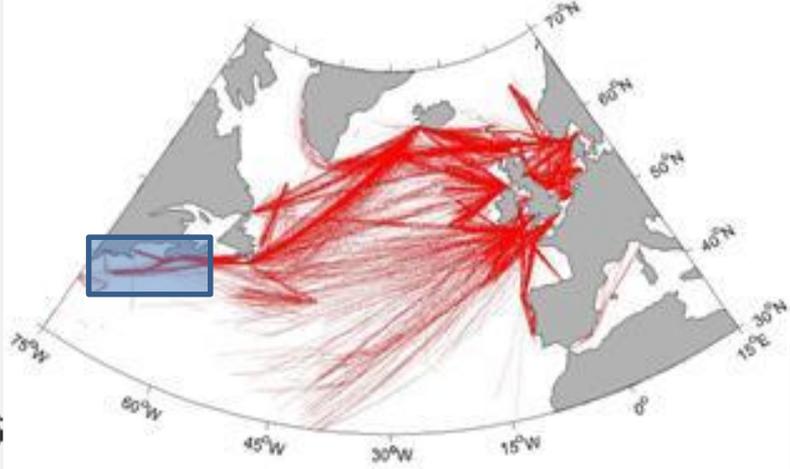

# What is the expected biomass of fish? Of phytoplankton?

0.004-0.04 mm?

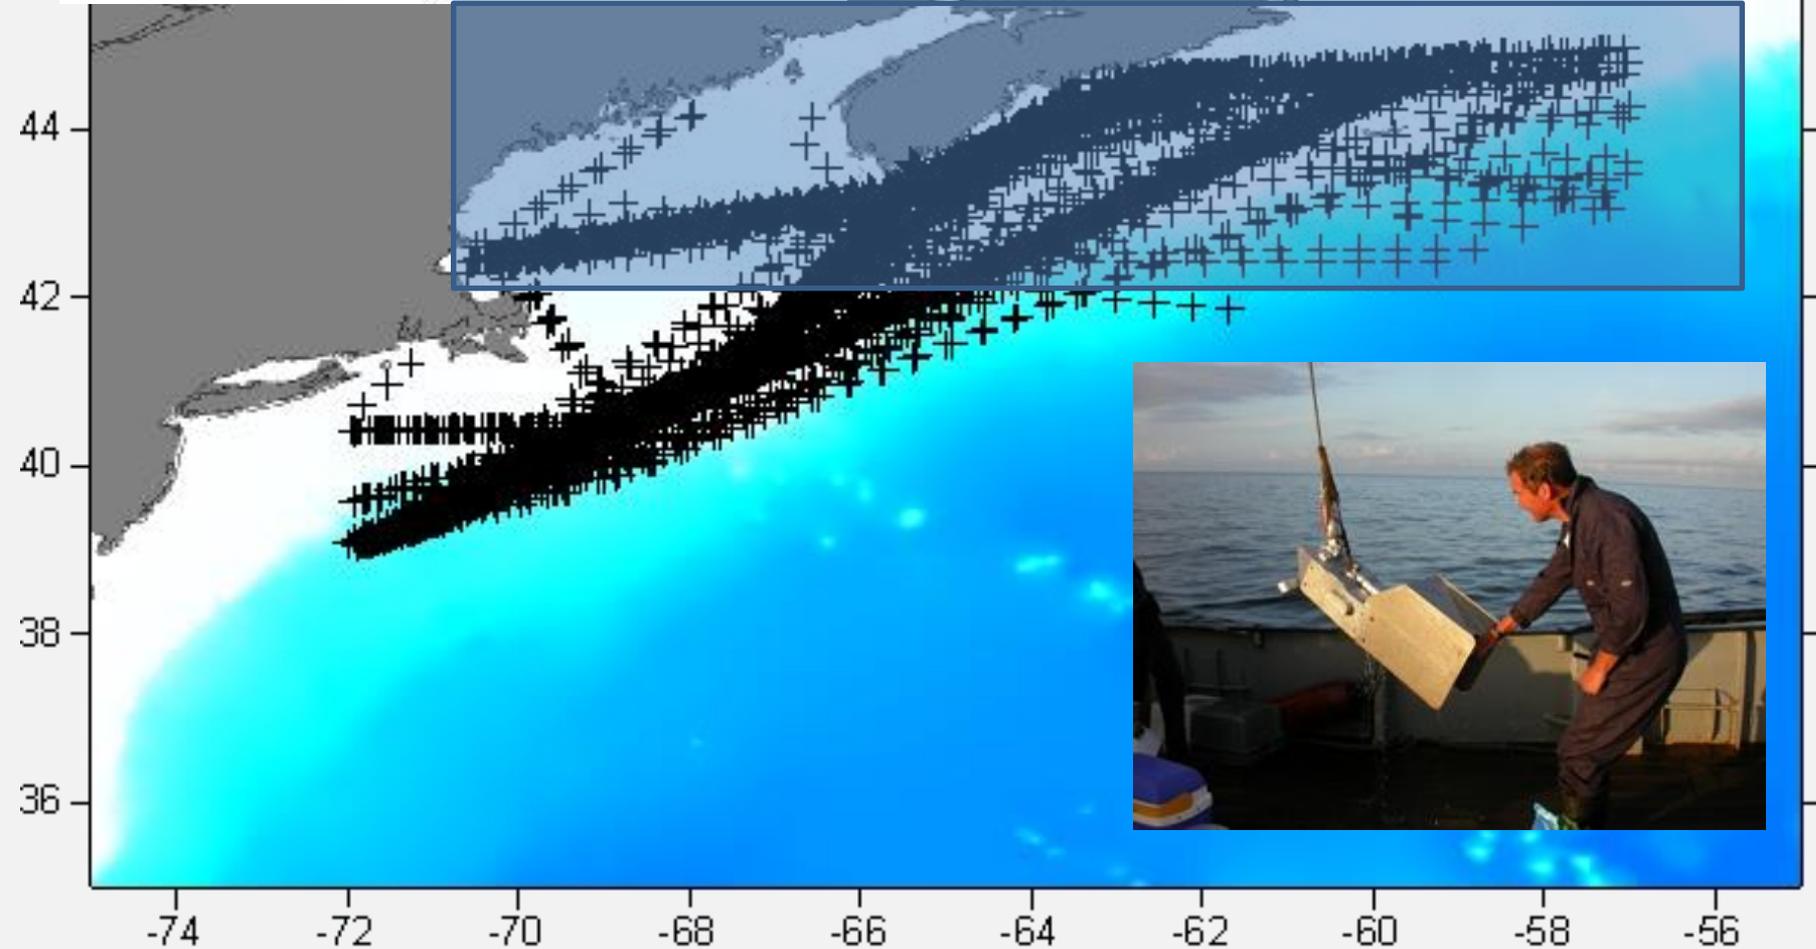

150-350 mm?

# Bottom-up forcing? Continuous Plankton Recorder

46

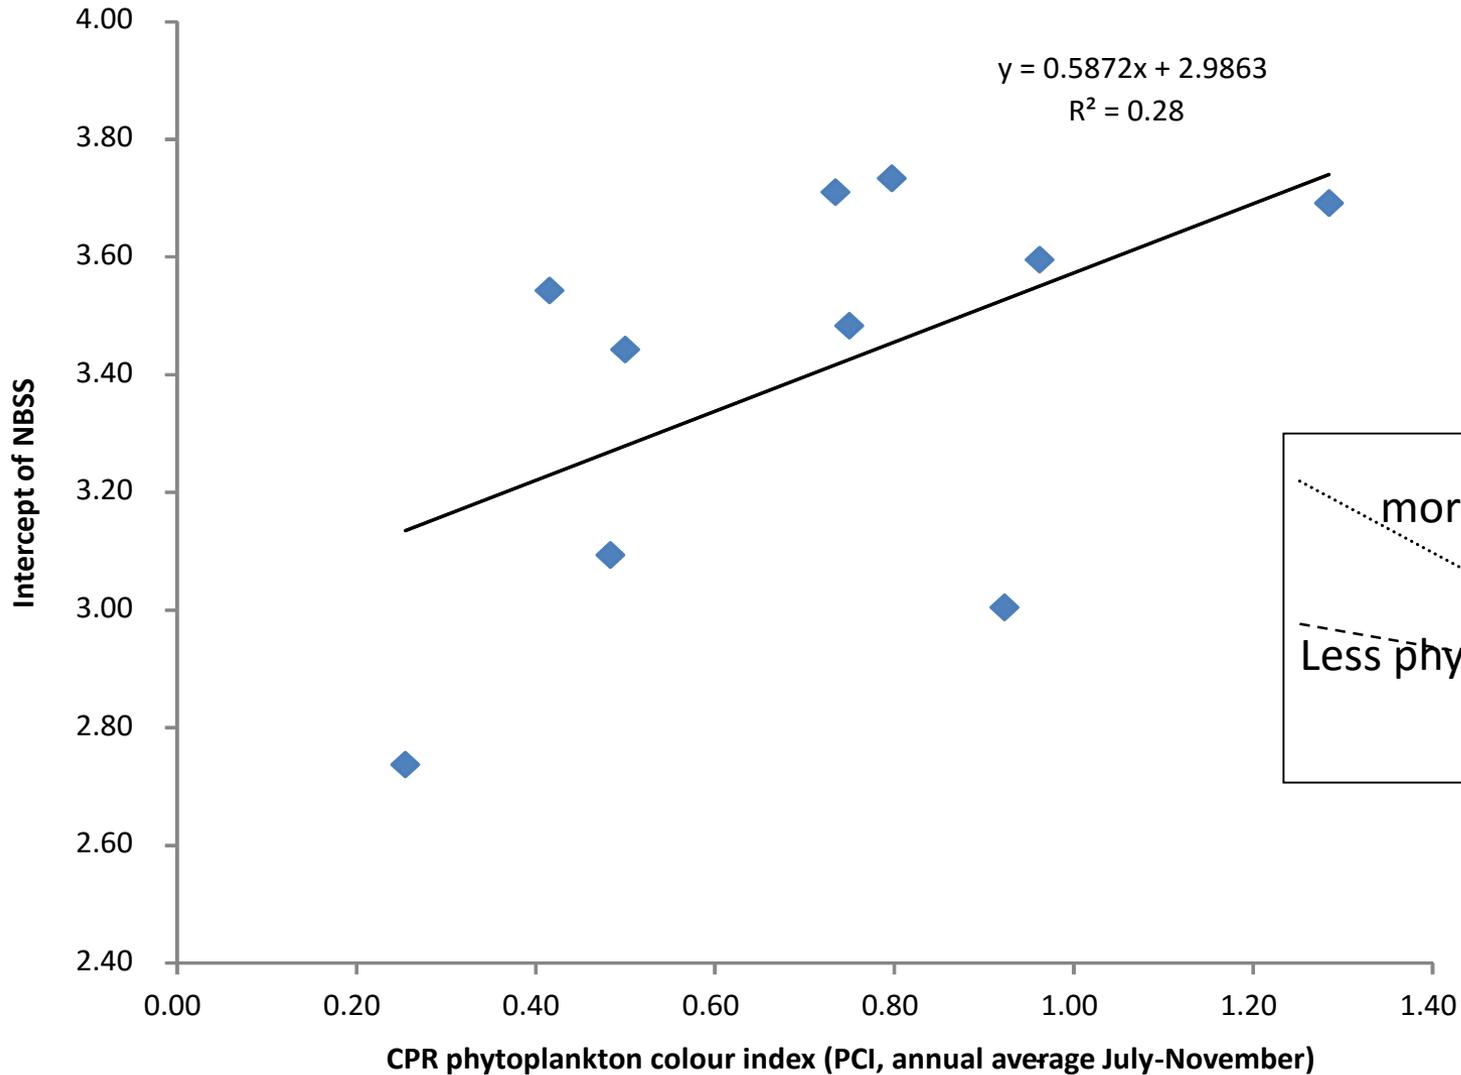

# greenness index, PCI

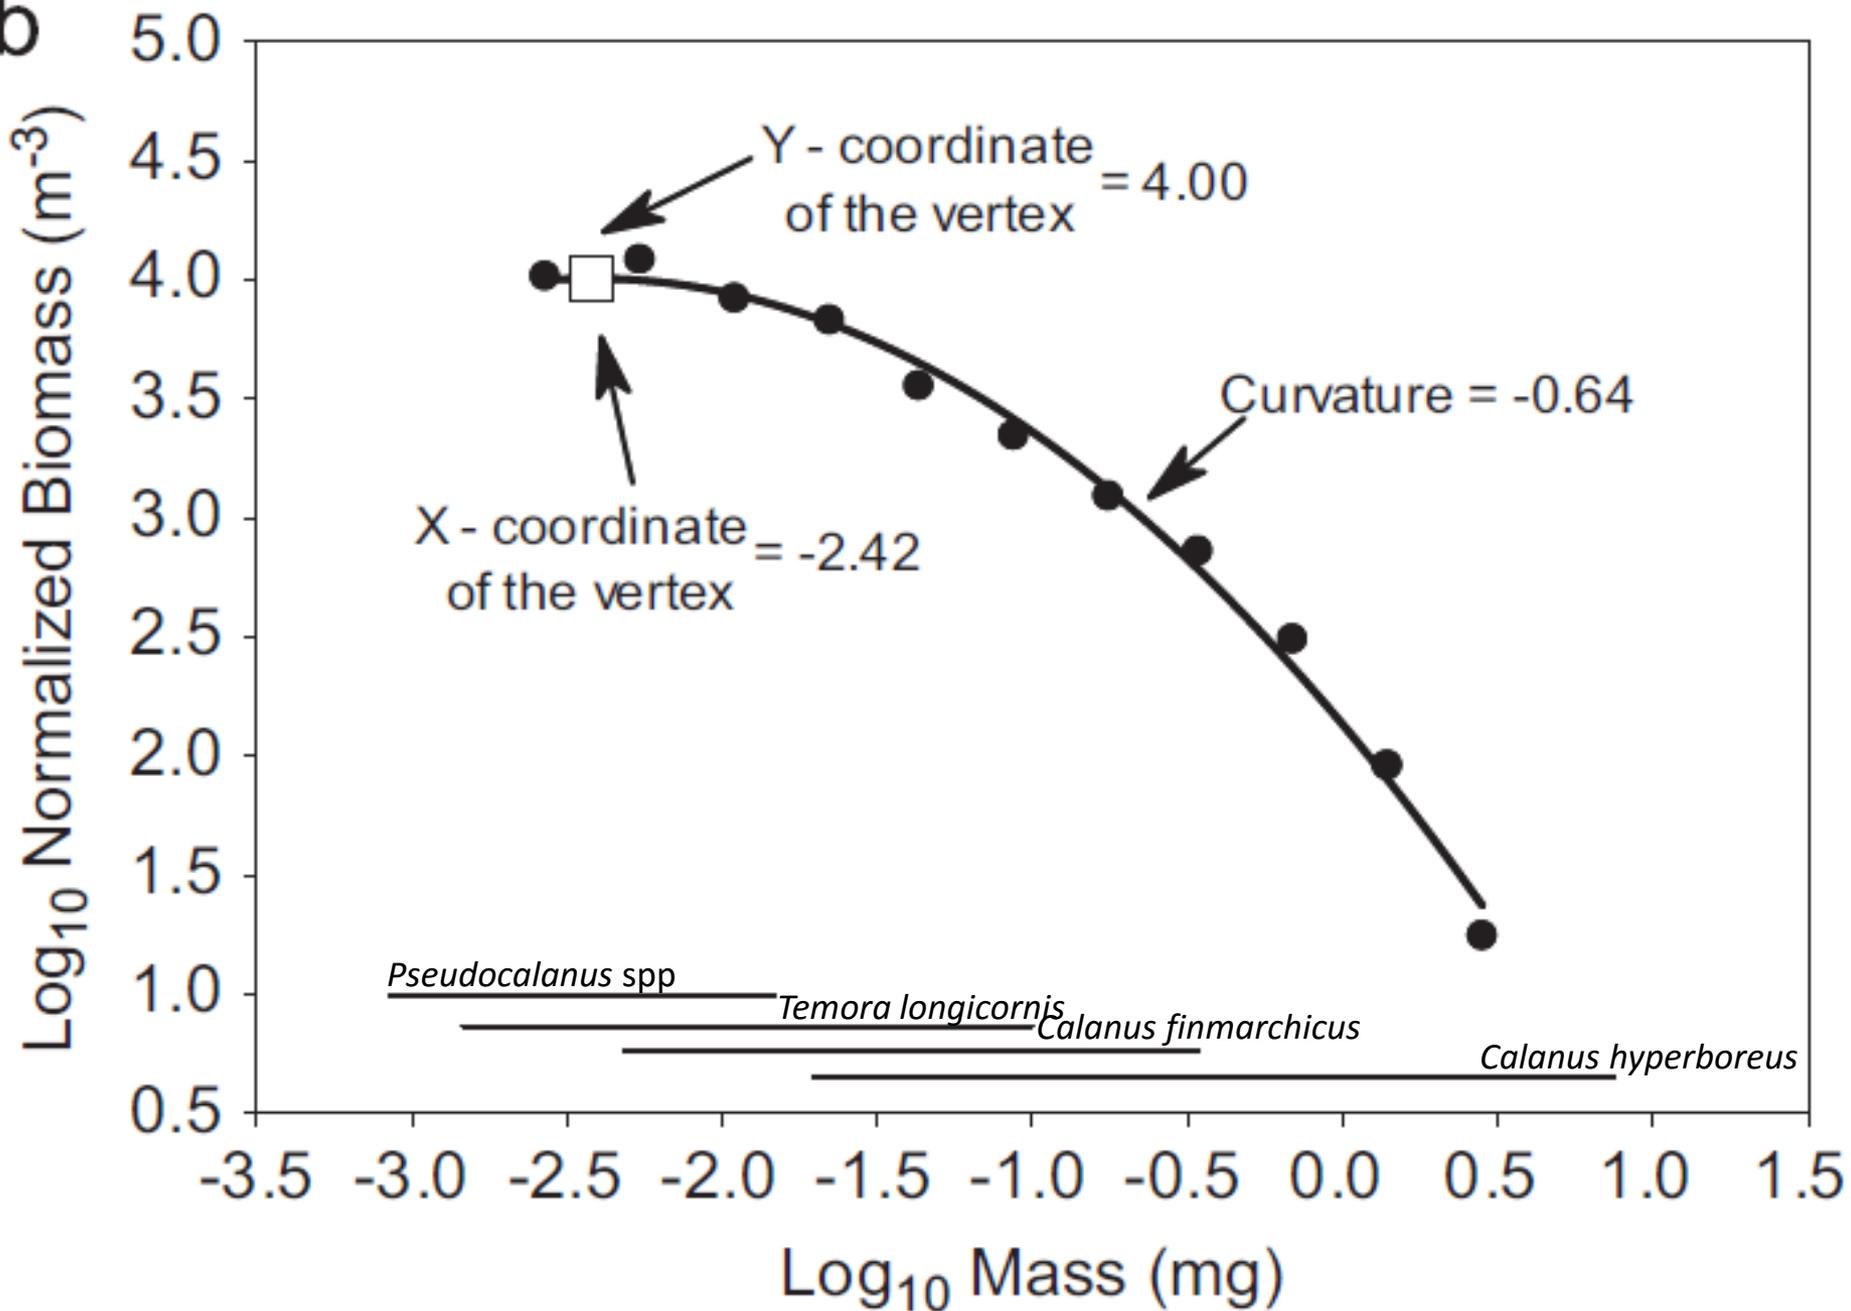

## “Phytoplankton Colour Index”

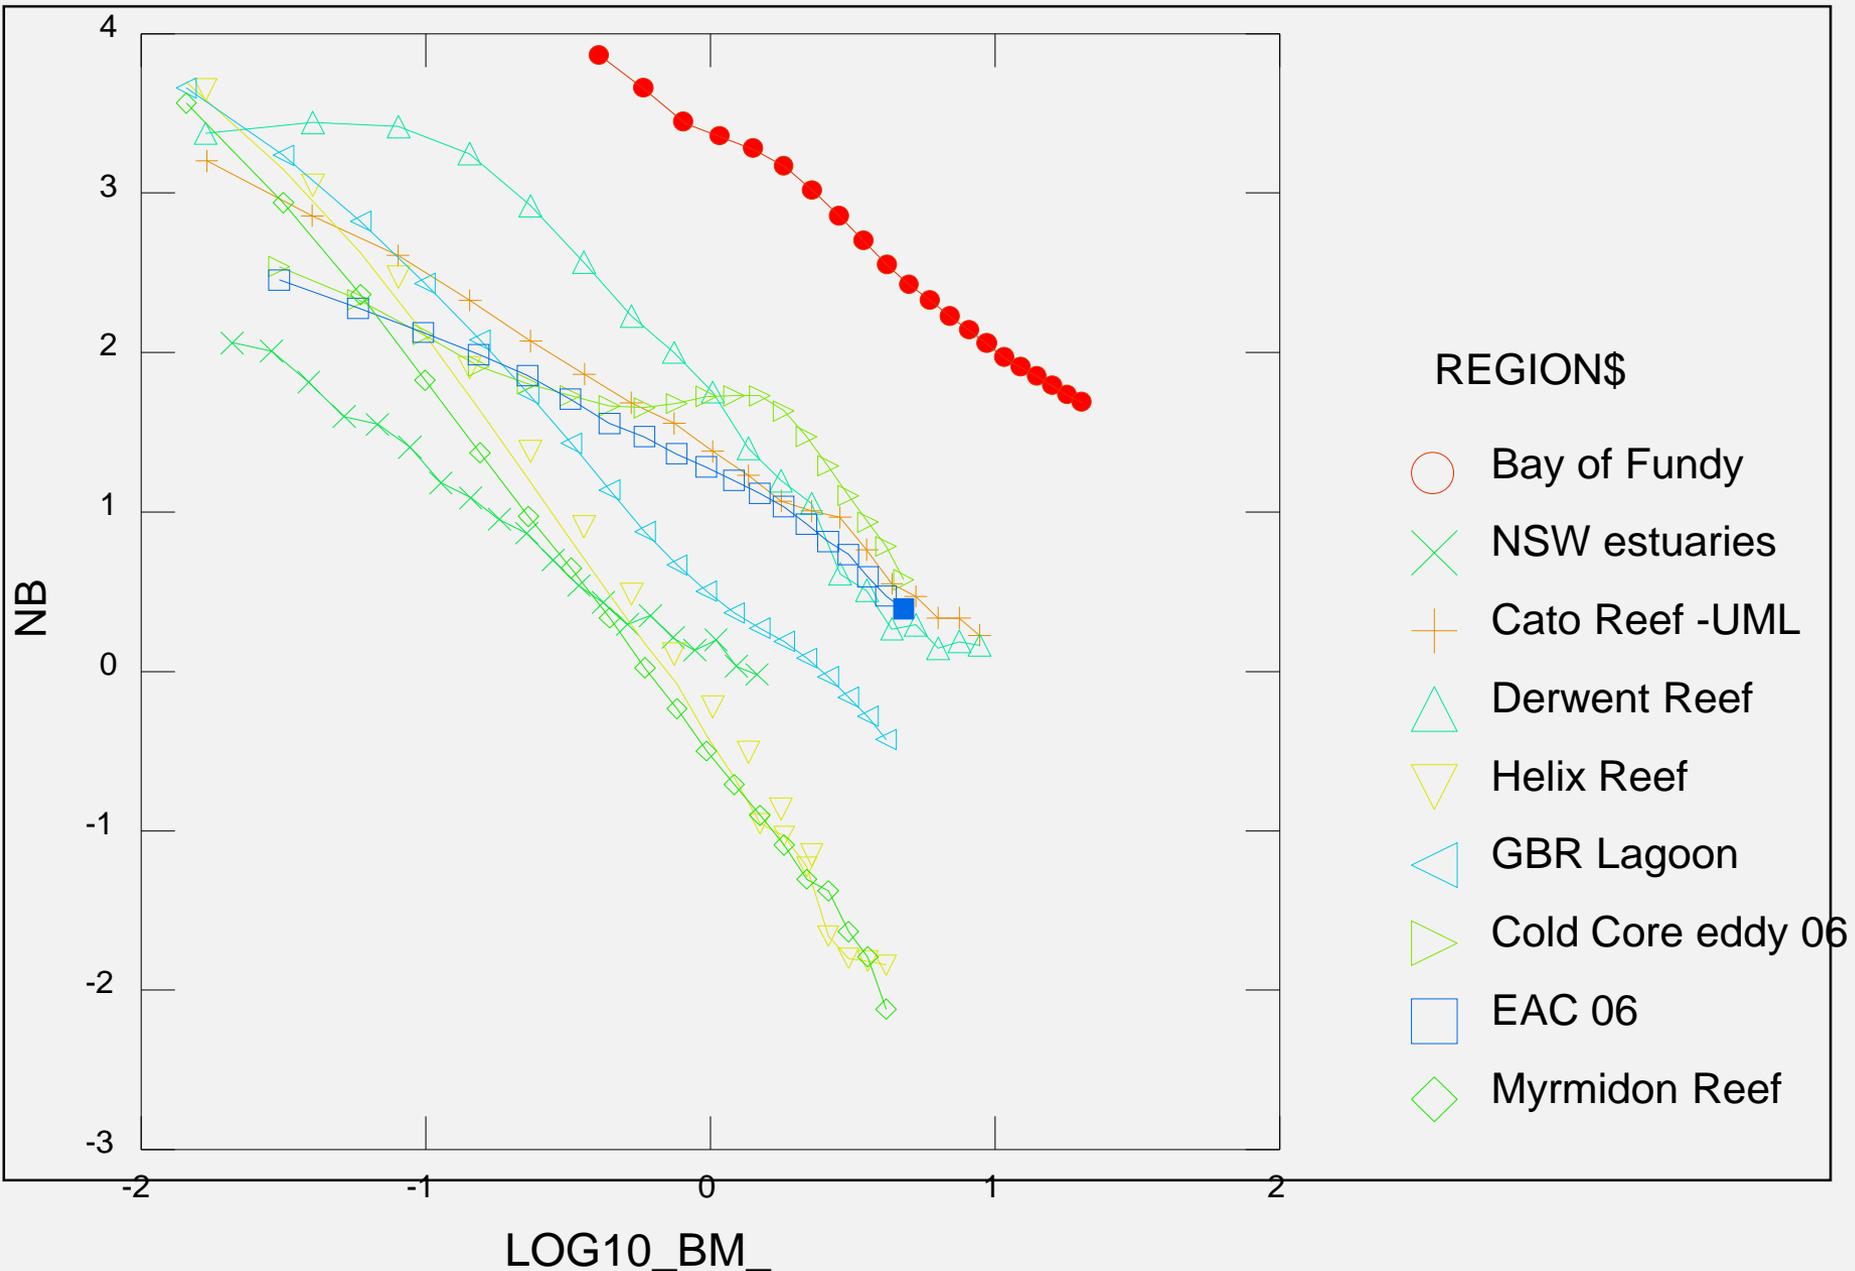

- PCI is recorded as 0,1,2 and 6.5
- Missing data from 1974 – 1990
- Is there a bottom-up effect on the biomass size distribution?
- If so, can we predict the missing years of chlorophyll from the NBSS?

	Jul-Nov avg
1972	0.25
1973	0.50
1974	
1975	
1976	
1977	
1991	0.48
1992	0.96
1993	1.28
1994	0.75
1995	0.80
1996	0.92
1997	0.42
1998	0.73

# Intercept of NBSS (1 mg)

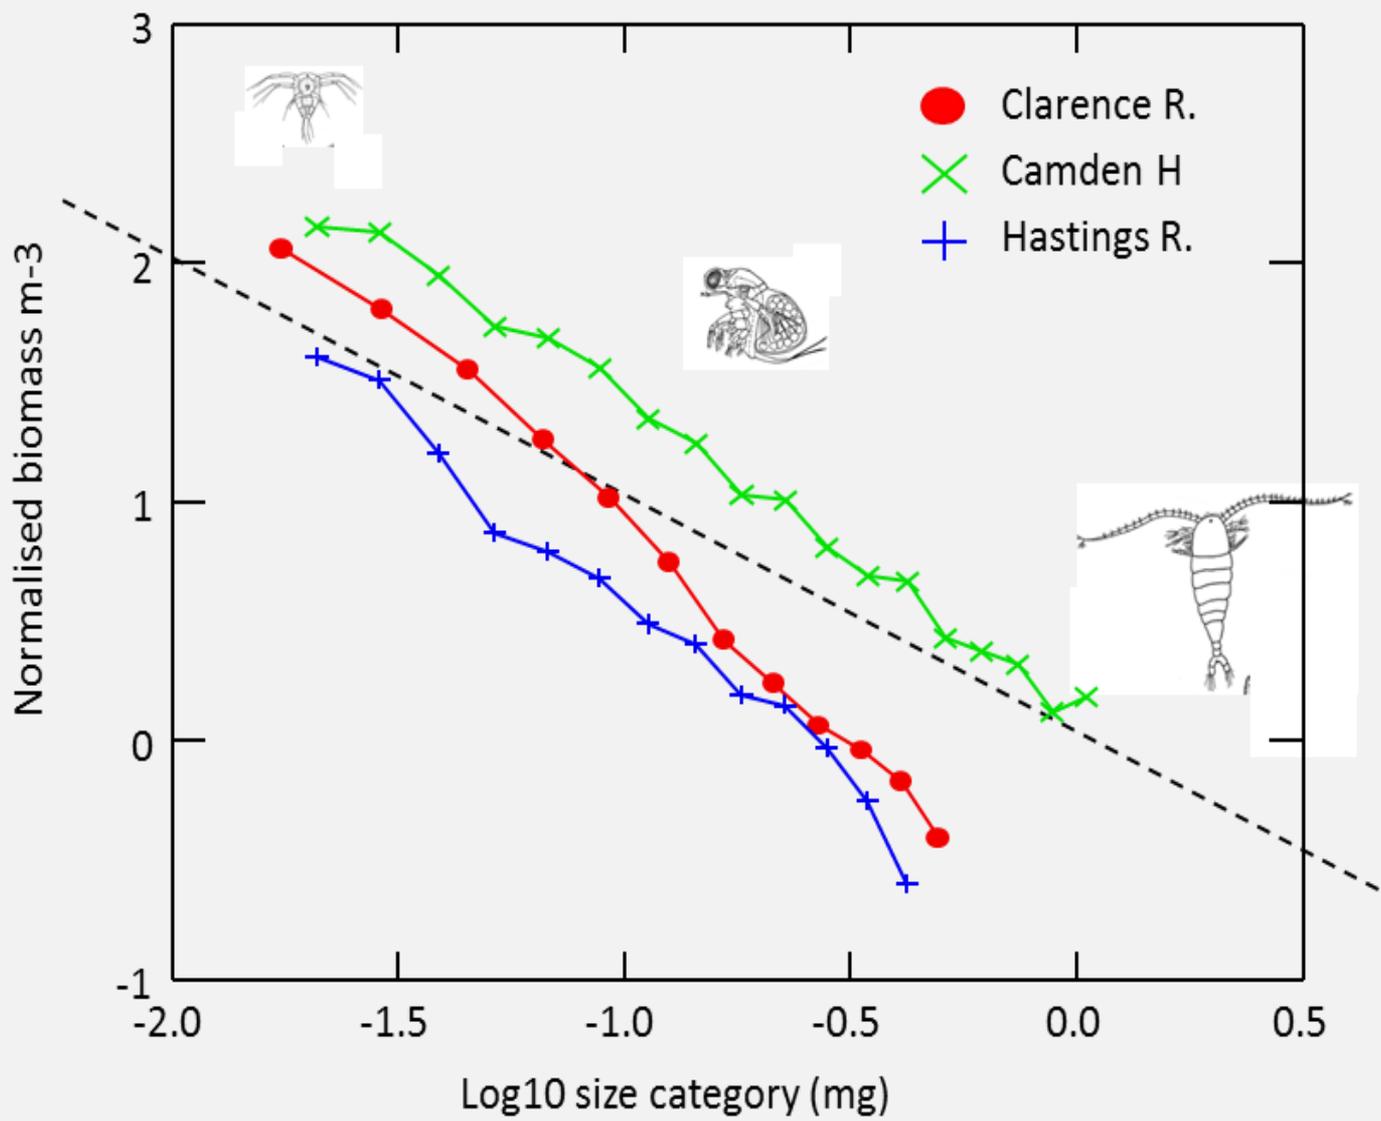

**b**

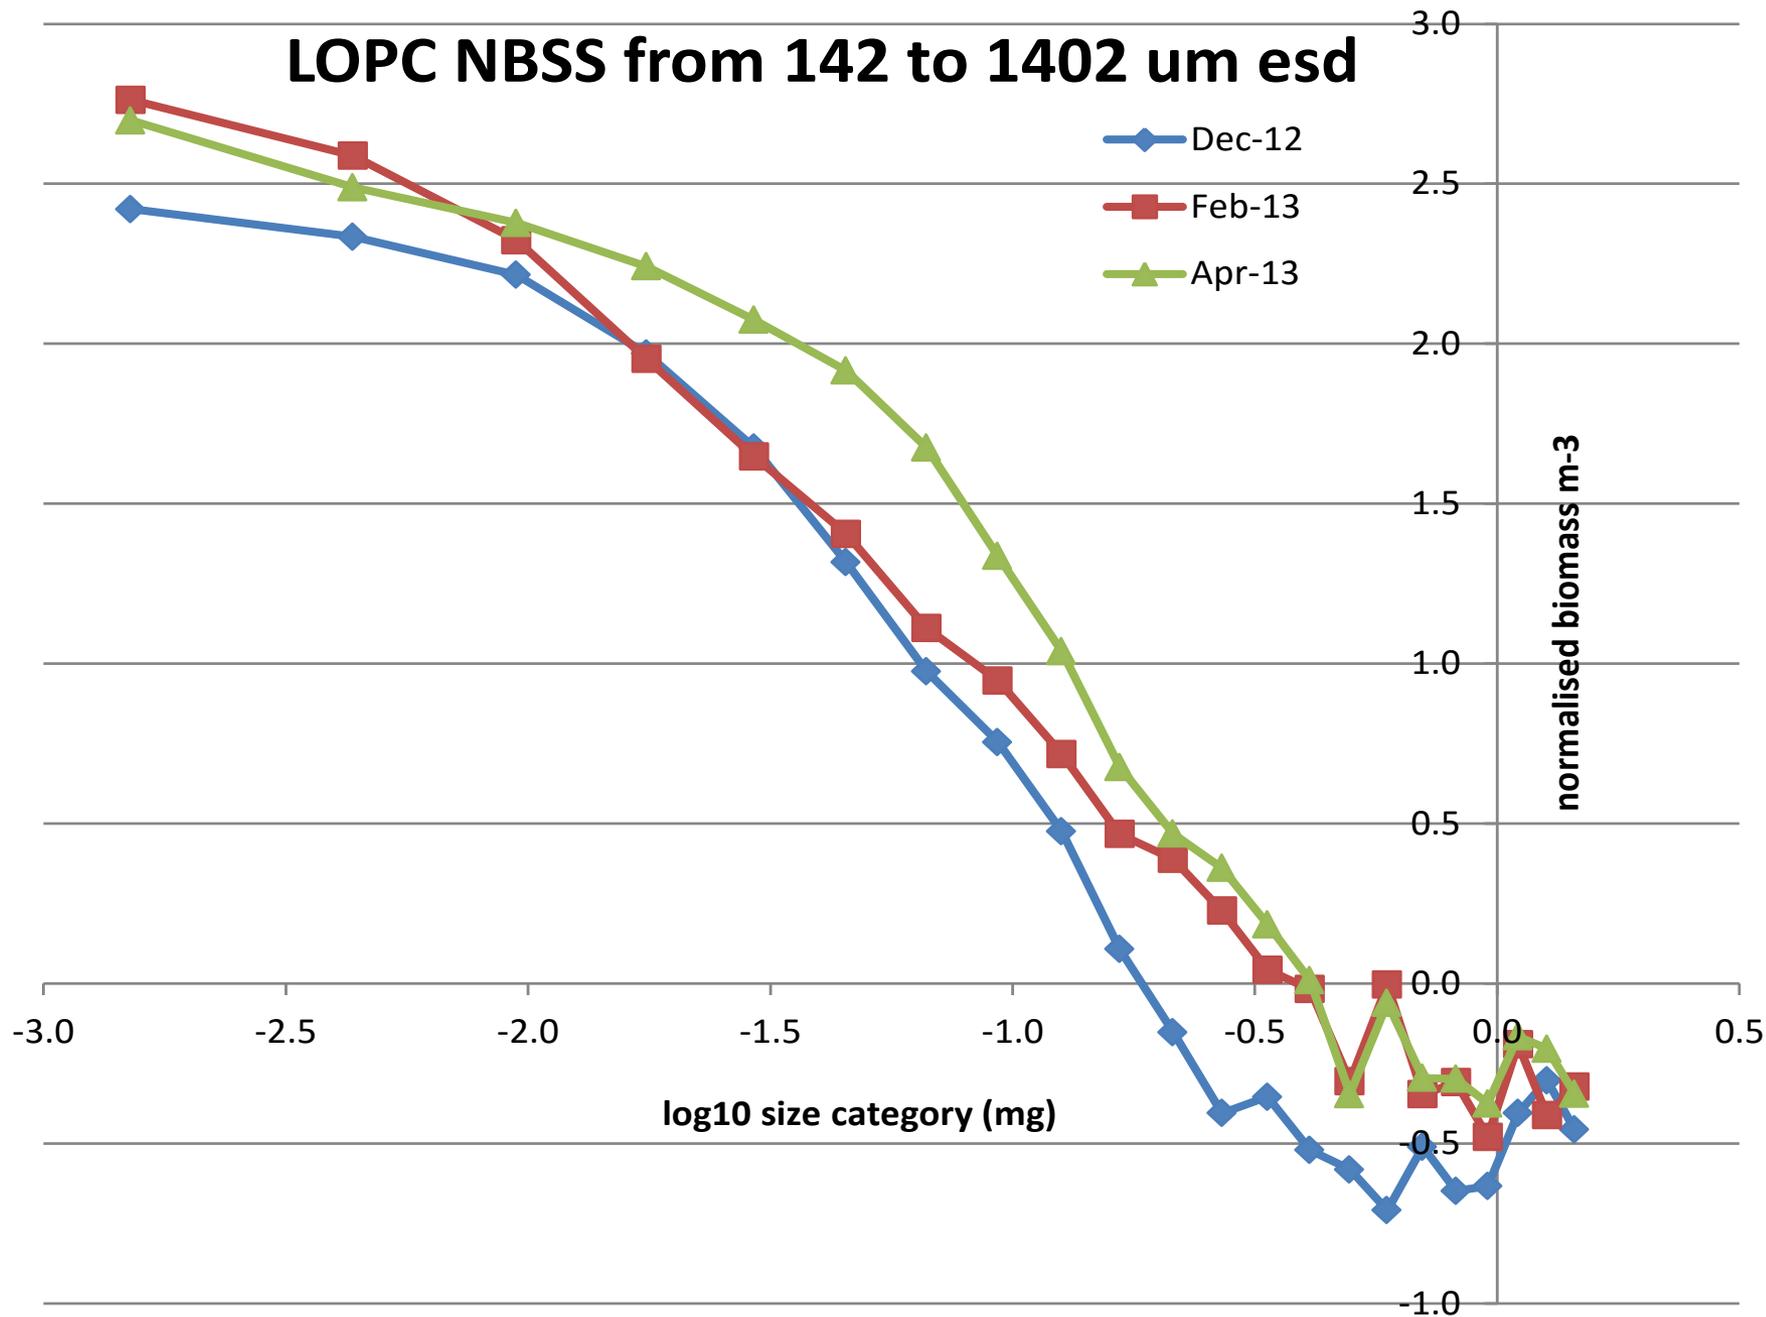

NB

LOG10\_BM\_

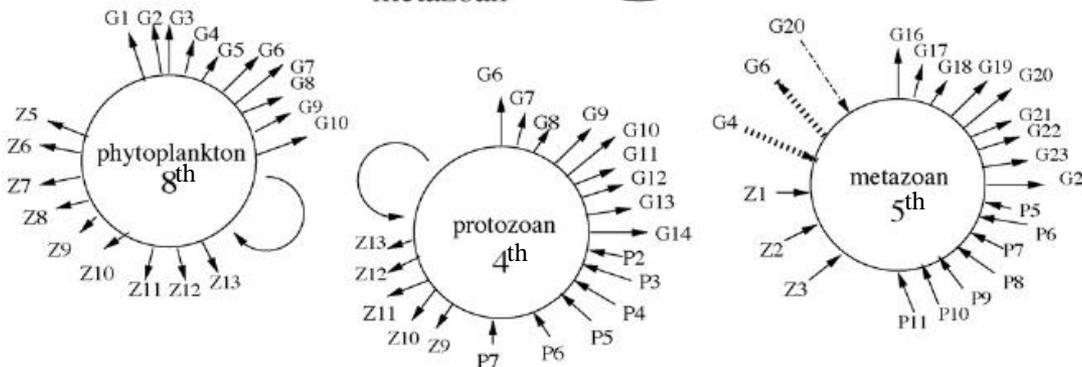

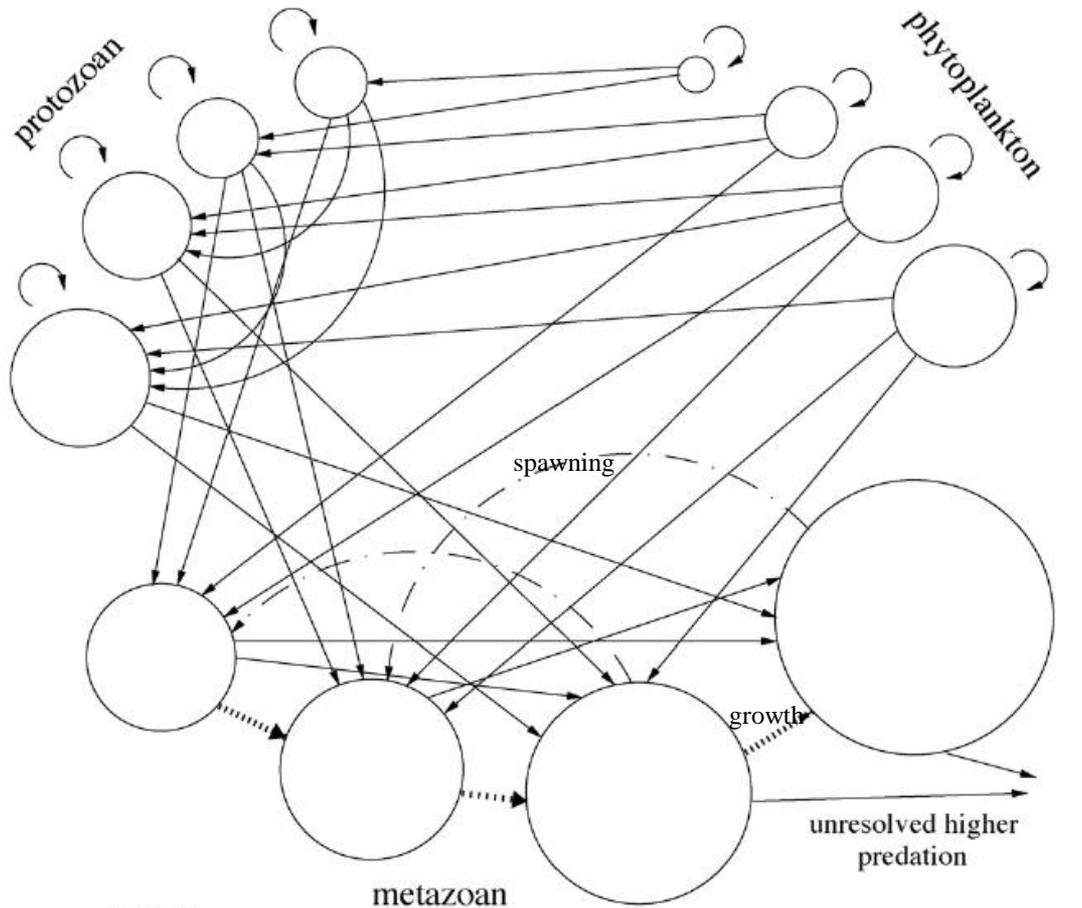

# LOPC NBSS from 142 to 1402 um esd

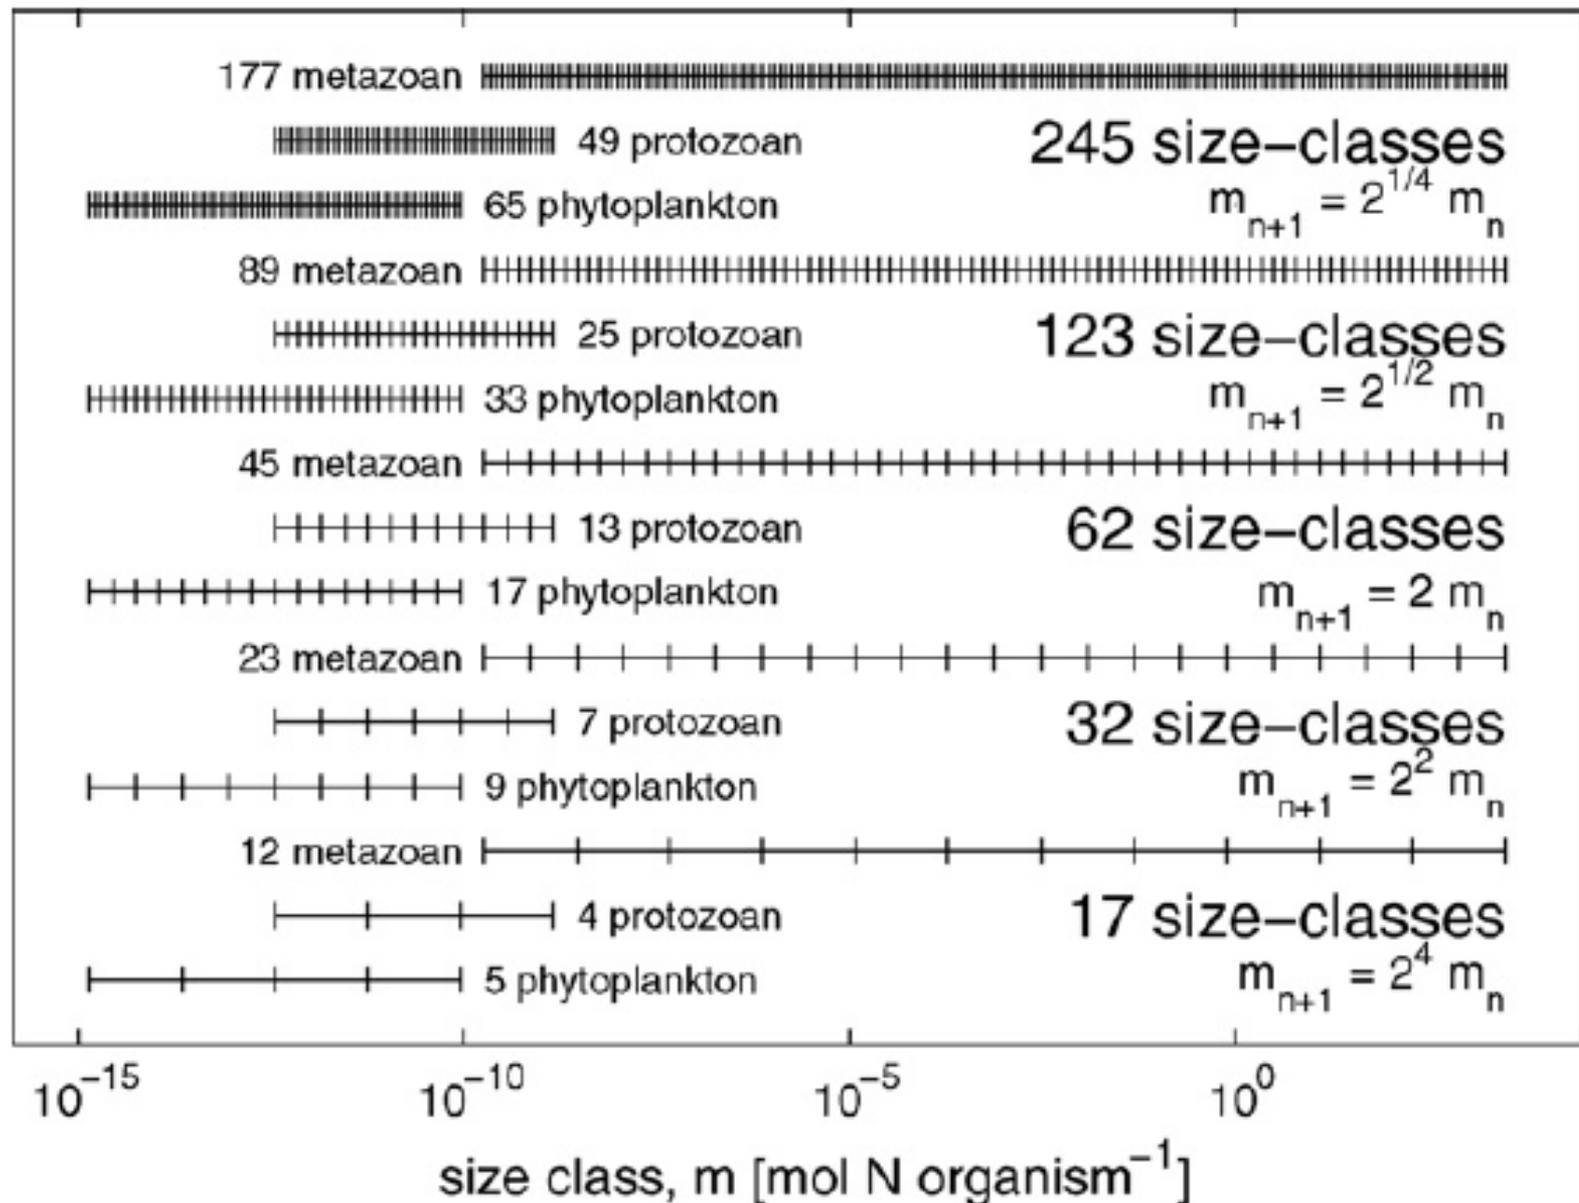

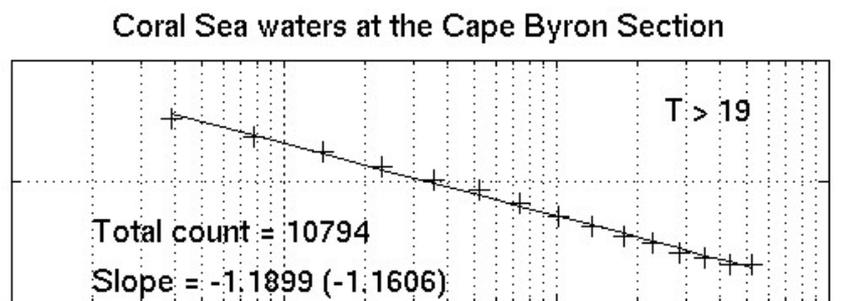

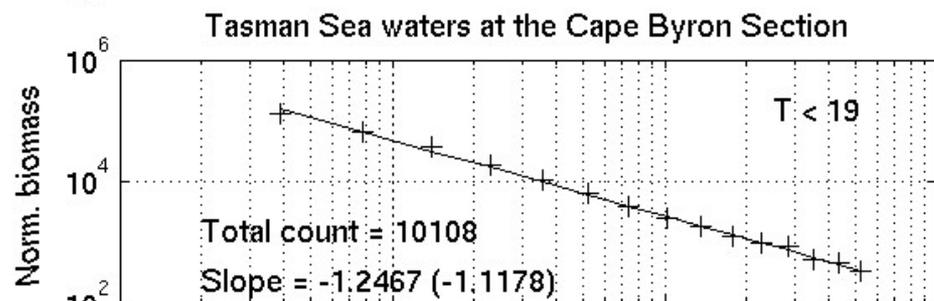

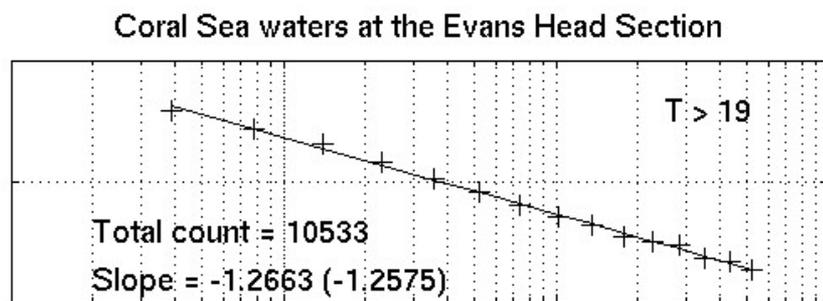

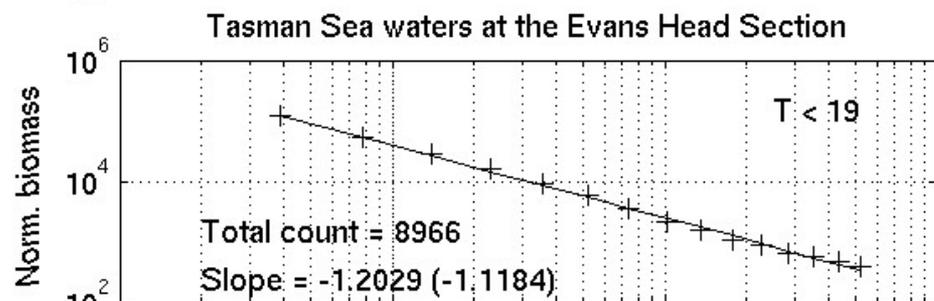

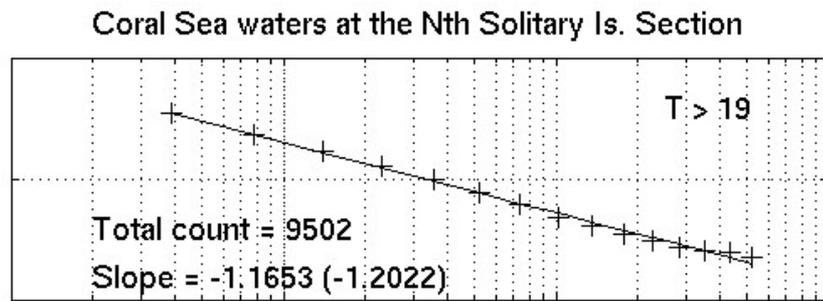

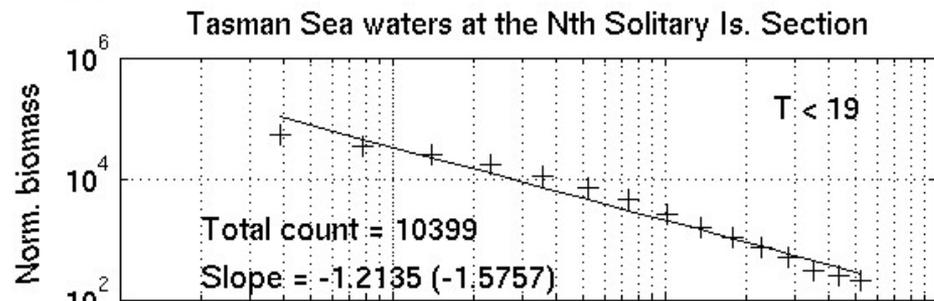

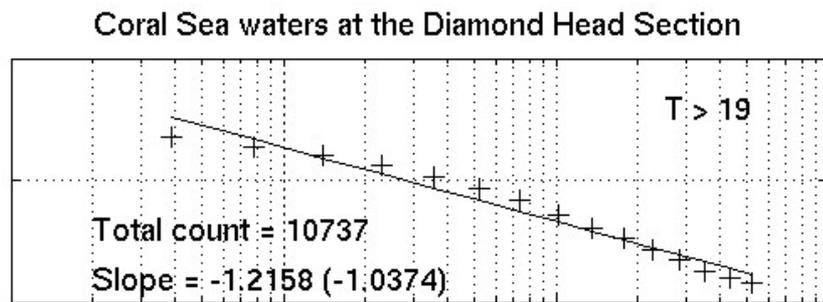

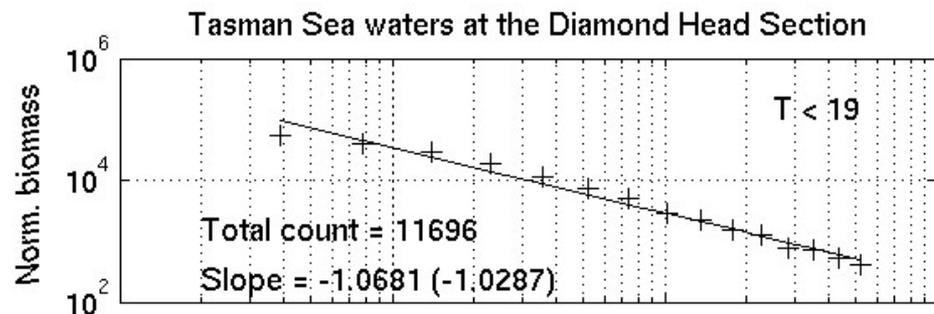

# A bio-mechanical, size resolved model

- 62 size classes
- 19 orders of magn.
- Phyto 1-17
- Protozoan 9-21
- Metazoan 18-62
- Complexity stabilises model
- Initial conditions?
- Coupled hydrogr
- Sensitivity: [DIN], protozoa biomass

Increasing model structural complexity inhibits the growth of initial condition errors

Size class ( $m^3$ )
