# Theme session example

Select ASC session type:	Theme session
Short Title:	Stock assessment methods, model complexity, and uncertainty
Session convener 1 (contact person) - Name (required):	Firstname Lastname
Session convener 1 (contact person) - institute address and country:	Institute Name, Institute Address, Country
Session convener 1 (contact person) - email:	<a href="mailto:xx@xx.xx.xx">xx@xx.xx.xx</a>
Session convener 1 (contact person) - telephone:	+national code and number
Session convener 2 - Name (required):	Firstname Lastname
Session convener 2 - Email:	<a href="mailto:xx@xx.xx.xx">xx@xx.xx.xx</a>
Session convener 3 - Name (3rd convener is optional):	
Session convener 3 - Email:	
Session convener 4 - Name (4th convener option for co-sponsored sessions only):	
Session convener 4 - Email:	
Description:	<p>Outputs from stock assessments make a fundamental contribution to fishery management advice. Recent advances in stock assessment methods include integrated models with time-varying processes, spatially explicit approaches, state-space algorithms, inclusion of multispecies and environmental processes as well as economic factors, techniques for data-limited situations, and rigorous evaluations of management strategies.</p> <p>Choice of model structure and assumptions will affect the management advice. Model structure may depend on data collected, findings from simulation analyses, and available expertise. Conversely, the choice of model structure may guide investments in data collection and analytical capacity. Thus, determining appropriate model complexity is an important decision in the fishery management process. Model ensembles offer a way to base management advice on a spectrum of model structures and assumptions.</p> <p>The final step in a stock assessment is effective communication of the main results, along with the corresponding uncertainties. Quantifying the uncertainty about stock status and catch forecasts is a challenge given the accumulating sources of uncertainty in the observed data and analytical assumptions, as well as the intrinsic variability in the biological and human components. Scientific advice should help stakeholders and managers to understand uncertainty, trade-offs, and risks, so management policies for each stock can incorporate the desired precaution.</p> <p>This theme session provides an opportunity to review the latest advances in stock assessment, to consider the choice and implications of different levels of model complexity, and to review methods for quantifying and communicating uncertainties. Three topics will be addressed during the theme session:</p> <p>(a) State of the art in stock assessment methods: to address improvements in stock assessment methods, implementation of random effects in time and space, analytical methods for data-limited situations; performance evaluation (e.g. MSE) of assessment</p>

	<p>methods and harvest policies; and multispecies and environmental processes in stock assessment, ecosystem and economic factors in harvest policy evaluation.</p> <p>(b) Stock assessment model complexity and model ensemble techniques: to address appropriate complexity of an assessment model for a given stock, basis of choosing a model, implications for data collection; application of model ensemble techniques in stock assessment; and performance of model ensemble, when applied to historical datasets and simulated data.</p> <p>(c) Quantifying and communicating uncertainties in stock assessment: to address quantifying uncertainties in fisheries catch statistics and survey data, assessment model choices and assumptions; developing harvest control rules, evaluating management strategies; quantifying overall uncertainty at the advice level, communication of uncertainties, interpretation of advice.</p> <p>[from/ based on a theme session held at ASC 2017]</p>
<b>Session teaser:</b>	Stock assessments help to quantify how fishing has affected stocks in the past and how different management decisions will affect stock sizes and yields in future. Methods of stock assessment are evolving rapidly. This theme session provides an opportunity to take stock of the latest advances in assessment, to consider the choice and implications of different levels of model complexity, and to review methods for quantifying and communicating uncertainties.
<b>Tweet text:</b>	Advances and challenges in stock assessment: join the debate on methods, complexity and uncertainty #ICESASC [link will be added by ICES]
<b>Suggested theme session format:</b>	<p>For each topic there will be an invited introductory keynote presentation (15 mins), followed by submitted presentations (15 min. slots).</p> <p>Poster authors will be asked to give speed-presentations to introduce their posters during the spoken session.</p> <p>To close the theme session, overviews of the topics addressed will be presented by the convenors.</p> <p>Posters will be displayed in the corresponding poster session.</p>
<b>Expected participation:</b>	Scientists internationally and members of ICES working groups with interests in stock assessment, fisheries management and collection and processing of data for stock assessment. Scientists participating in the "stock assessment" research project (2019-2022, 8 countries participating) and the "ensemble modelling" research project (2018-2023, 6 countries participating). Science advisers focusing on stock assessment, including members of the ICES Advisory Committee.
<b>Links to the seven ICES science priority areas as proposed by the Science Committee (see link to codes above):</b>	Food from the sea (Code 1); Impacts of human activities (Code 3); Observation and exploration (Code 4); Emerging techniques and technologies (Code 5); Conservation and management (Code 6)
<b>Links to ICES Steering Groups and/or Advisory Committee:</b>	Ecosystem Observation Steering Group; Human Activities, Pressures and Impacts Steering Group; Integrated Ecosystem Assessments Steering Group; Advisory Committee
<b>Links to ICES Strategic Initiatives (if relevant):</b>	Strategic Initiative on the Human Dimension
