

Tagging experiments on cod in the Baltic  
in 1972-1975

by Kondratovich E.Y.

ANNOTATION

Il est cité dans l'exposé les résultats du marquage de la morue Baltique du 1972 au 1977 dans les régions de Ventspils, Liépaya, Klaipéda, Gotland-sud et Bornholme.

Il est constaté que la morue Baltique ne tient pas aux régions déterminées, mais a la tendance aux migrations sur tous le plan d'eau du creux de Bornholme jusqu'au golfe de Finlande. Cela correspond surtout au stock de la morue de Gotland. Le stock de la morue de Bornholme mène la vie plus sédentaire

Tagging experiments on cod in the Baltic  
in 1972-1975

Kondratovich E. Y.

Baltic Fisheries Research Institute / BaltNIIRH / x/

Cod for tagging were caught with bottom trawl / trawling duration-30 minutes / in Ventspils, Liepaya, Klaipeda, Southern, Gotland, and Bornholm regions.

Two types of tags were used: plastic capsules with a letter inside / till March, 1974 / , and flat plastic tags with red flags / from December, 1974 / .

Tags were attached by stainless steel wire between the first and the second dorsal fins of a fish.

Of the total 3686 specimens tagged, 3260 were tagged in March-April, the rest-in December-January. /Table 1/.

x/ BaltNIIRH  
Daugavgrivas 6,  
Riga -49,  
USSR

The depth in the regions of tagging was: in Southern Gotland—  
100-120m; in Bornholm-70-90m, in the area from Klaipeda-Ventspils-  
50-80m.

Mean tags return by regions makes up 8,5%. The largest tag  
return is noted in Bornholm / up to 29% / and Southern Gotland  
/ up to 11,3% / areas. This, apparently, is explained by the fact  
that the Bornholm cod stock leads a more settled mode of life / 1 /,  
since its feeding sites are not far from spawning grounds. Besides,  
more intensive fishing over a relatively small area is carried out  
in Bornholm and Southern Gotland regions that makes a great effect  
upon tags return / 2 / .

Relatively small tag return in Southern Gotland in April 1975  
besides other factors / younger individuals, lesser number of  
tagged fish, ect. / perhaps is also connected with the use of a  
new and less visible type of tags / Table 2 / .

Recapture of tagged cod by seasons depends upon the region  
and the time of tagging / Table 1 / . Thus, if the cod was tagged  
in March-April, then in the places of spawning—in Bornholm and  
Southern Gotland regions—it is caught in the main / 60-70% / just  
within the first 2-3 months, but on the feeding sites—in Ventspils,  
Liepaya and Klaipeda regions—two-three months after tagging in the  
second half year. It is connected with the distribution of fish  
and, as the result with more intensive cod fishing on spawning si-  
tes in spring and with lesser one—at the same time on feeding  
areas.

Cod migrations from the regions of tagging in spawning and

feeding periods are given in Table 3.

Cod migrations from the regions of tagging differ. Of all fish tagged in Ventspils region, about 80% remained in the tagging region. From Liepaya region about 20% migrated northwards, 70% remained in the region of tagging. The largest migrations are observed from the Klaipeda region-about 44% northwards / in the feeding period basically / , 30% remained in the region of tagging and are mainly caught in the period of spawning, i. e. within the first 2 months after tagging, the rest-migrated to the places of spawning in Gotland and Gdansk Deeps.

Thus, a conclusion may be, that the cod from the south-eastern Baltic / Gotland Deep, Klaipeda and Liepaya regions / during feeding period migrates northwards to Ventspils region and to the north of the region where the richest feeding areas are situated.

Migrations from the places of spawning depend upon the time of tagging. Thus, 80% of the cod tagged in Bornholm region in March-April were caught in the same region, but of fish tagged in December only 35% have remained in tagging region.

An interchange between Bornholm and Gotland and Gotland cod / with the adjacent Klaipeda, Liepaya and Ventspils regions / in recent years was rather bad, more cod having migrated from Bornholm region eastwards / to Gotland Deep and Klaipeda region / than from the eastern regions to the west.

#### Summary

The results of baltic cod tagging for the 1972-1975 period in Ventspils, Liepaya, Klaipeda, Southern Gotland and Bornholm regions are given.

It is determined that baltic cod do not keep to definite regions but have a tendency to migrate over the whole sea area from Bornholm Deep to the Gulf of Finland. Particularly it refers to the Gotland cod stock. The Bornholm cod stock leads more settled mode of life.
