

## Herring (*Clupea harengus*) in subdivisions 25–29 and 32, excluding the Gulf of Riga (central Baltic Sea)

### ICES advice on fishing opportunities

ICES advises that when the EU multiannual plan (MAP) for the Baltic Sea is applied, catches in 2022 that correspond to the F ranges in the plan are between 52 443 tonnes and 87 581 tonnes. According to the MAP, catches higher than 71 939 tonnes can only be taken under conditions specified in the plan, whilst the entire range is considered precautionary when applying ICES advice rule. The current advice applies to all catches from the stock, including those taken in Subdivision 28.1.

### Stock development over time

ICES assesses that fishing pressure on the stock is above  $F_{MSY}$  and between  $F_{pa}$  and  $F_{lim}$  and that spawning-stock size is below  $MSY B_{trigger}$  and between  $B_{pa}$  and  $B_{lim}$ .

**Figure 1** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Summary of the stock assessment. SSB at spawning time in 2021 is predicted.

### Catch scenarios

**Table 1** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Assumptions made for the interim year and in the forecast.

Variable	Value	Notes
$F_{ages\ 3-6}$ (2021)	0.34	Based on a TAC constraint*
SSB (2021)	365448	Projected at spawning time; tonnes
$R_{age\ 1}$ (2021)	12130000	RCT3 estimate; thousands
$R_{age\ 1}$ (2022–2023)	11950996	Geometric mean 1988–2019; thousands
Total catch (2021)	129726	TAC constraint*; tonnes

\*TAC constraint in 2021: EU share (97 551 tonnes) + Russian quota (28 500 tonnes) + central Baltic herring stock caught in Gulf of Riga (4189 tonnes [mean 2015–2019]) – Gulf of Riga herring stock caught in central Baltic Sea (514 tonnes [mean 2015–2019]) = 129 726 tonnes.

**Table 2** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Annual catch scenarios. All weights are in tonnes.

SSB (2023) = SSB (2022)	173178	0.45	388815	388815	0%	55%
F = F <sub>2021</sub>	137322	0.34	402308	433000	8%	23%

\* SSB 2023 relative to SSB 2022.

\*\* Advice value in 2022 relative to advice value for EU MAP: F<sub>MSY 2021</sub> = F = F<sub>MSY</sub> × SSB<sub>2020</sub>/MSY B<sub>trigger</sub> (111 852 tonnes).

\*\*\* Advice value for 2022 relative to advice value for EU MAP: F<sub>lower 2021</sub> (83 971 tonnes).

<sup>#</sup> For spring-spawning stocks, the SSB is determined at spawning time and is influenced by fisheries and natural mortality between the 1<sup>st</sup> of January and spawning time (April).

<sup>^</sup> Advice value for 2022 relative to advice value for EU MAP: F<sub>upper 2021</sub> (138 183 tonnes).

<sup>^^</sup> MAP multiannual plan (EU, 2016).

The decrease in catch advice is mainly due to the downward revision of the year class in 2019.

### Basis of the advice

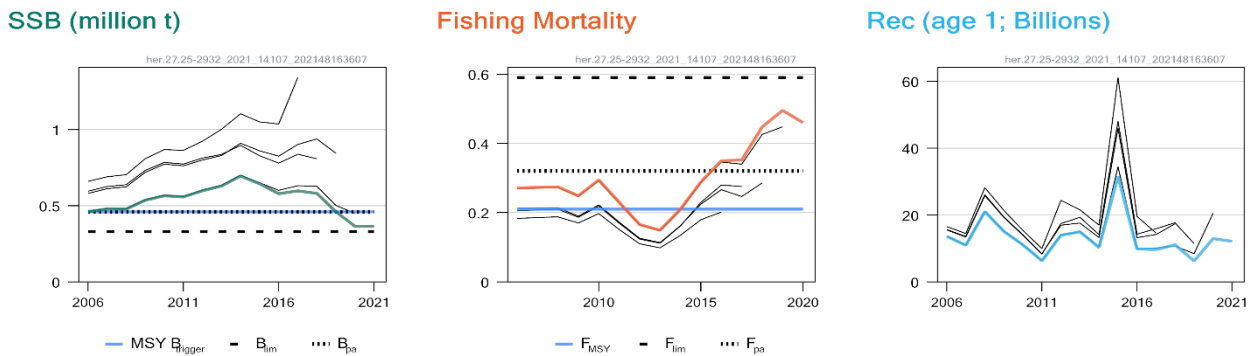

**Table 3** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. The basis of the advice.

Advice basis	EU Baltic multiannual plan
Management plan	This stock is shared between the EU and Russia. An EU multiannual plan (MAP) in place for stocks in the Baltic Sea includes herring (EU, 2016, 2019). The advice, based on the F <sub>MSY</sub> ranges used in the management plan, is considered precautionary. Russia does not have a management plan for this stock.

## Quality of the assessment

The interbenchmark assessment (ICES, 2020), which introduced updated natural mortalities for 1974–2018, led to a downward revision of SSB and an upward revision of fishing mortality last year.

Species misreporting of herring has occurred in the past, and there is evidence of sprat being misreported as herring. These effects have not been quantified nor included in the assessment; however, they may affect the quality of the assessment.

**Figure 2** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Historical assessment results (final-year recruitment estimates included). The stock was interbenchmarked in 2020 with updated natural mortality data. The reference points were updated at the interbenchmark, and only assessment results from the last two years should be compared to the reference points indicated

## Issues relevant for the advice

The 2019 year class which was estimated to be strong in last years assessment is now estimated to be below average. There has been no strong recruitment since 2015.

A mixture of central Baltic herring (subdivisions 25–27, 28.2, 29, and 32) and Gulf of Riga herring (Subdivision 28.1) is caught in the central Baltic Sea. In the assessment and the advice, the central Baltic herring stock is considered to be caught both in and outside of the central Baltic Sea. The TAC (sum of the EU and Russian autonomous quotas) is set for herring caught in the central Baltic management area; it includes a small amount of Gulf of Riga herring caught in the central Baltic Sea but excludes central Baltic herring caught outside of the central Baltic Sea.

The TAC value proposed for the central Baltic area is based on the advised catch for the central Baltic herring stock, plus the assumed catch of Gulf of Riga herring taken in the central Baltic, minus the assumed catch of central Baltic herring taken in the Gulf of Riga. The values of the two latter figures are given by the average over the last five years.

- Central Baltic herring assumed to be taken in the Gulf of Riga in 2022 (Subdivision 28.1) is 3448 tonnes (average 2016–2020).
- Gulf of Riga herring assumed to be taken in Subdivision 28.2 in 2022 is 696 tonnes (average 2016–2020).

As an example, following ICES MSY approach (here identical to the MAP  $F_{MSY}$ ), catches from the central Baltic herring stock in 2022 should be no more than 88 887 tonnes. The corresponding TAC in the central Baltic management area for 2022 would be calculated as: 71 939 tonnes + 696 tonnes - 3448 tonnes = 69 187 tonnes.

## Reference points

**Table 4** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Reference points, values, and their technical basis. Weights are in tonnes.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	460 000	$B_{pa}$	ICES (2020)
	$F_{MSY}$	0.21	Estimated by EqSim	ICES (2020)
Precautionary approach	$B_{lim}$	330 000	The lowest SSB that has resulted in above-average recruitment, i.e. year 2002 (the SSB in 2002 happens to correspond to $B_{loss}$ )	ICES (2020)
	$B_{pa}$	460 000	$1.4 \times B_{lim}$	ICES (2020)
	$F_{lim}$	0.59	Estimated by EqSim as the F with 50% probability of SSB being less than $B_{lim}$	ICES (2020)
	$F_{pa}$	0.32	$F_{P05}$ . The F that leads to SSB $\geq B_{lim}$ with 95% probability	ICES (2021a)
Management plan	MAP MSY $B_{trigger}$	460 000	MSY $B_{trigger}$	ICES (2020)
	MAP $B_{lim}$	330 000	$B_{lim}$	ICES (2020)
	MAP $F_{MSY}$	0.21	$F_{MSY}$	ICES (2020)
	MAP target range $F_{lower}-F_{MSY}$	0.15–0.21	Consistent with the ranges which result in no more than a 5% reduction in long-term yield compared to MSY	ICES (2020)
	MAP target range $F_{MSY}-F_{upper}$	0.21–0.26	Consistent with the ranges which result in no more than a 5% reduction in long-term yield compared to MSY	ICES (2020)

## Basis of the assessment

**Table 5** Herring in subdivisions 25–29 and 32, excluding the Gulf of Riga. Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2021b)
Assessment type	Age-based analytical assessment, XSA (ICES, 2021a) that uses catches in the model and in the forecast
Input data	Commercial catches (international landings, age distributions from catch sampling); one survey acoustic index (BIAS A1588); natural mortalities from multispecies model (SMS) until 2018, 2019 = 2018 (ICES, 2019), 2020 from regression with eastern Baltic cod biomass of individuals $\geq 20$ cm, fixed maturity ogive
Discards and bycatch	Discarding is considered negligible
Indicators	None
Other information	Interbenchmark in March 2020 (ICES, 2020)
Working group	Baltic Fisheries Assessment Working Group (WGBFAS)
